Introduction

This document defines the Efinity[®] software technology-mapped logic primitives for Titanium FPGAs. These primitives are the basic building blocks of the user netlist that is passed to the place-and-route tool.

Core Primitives

The core primitives represent the functionality of the XLR cells, RAM blocks, DSP Blocks, and global clock buffers. These primitives connect to the interface primitives through a signal interface.

Figure 1: Core Primitives

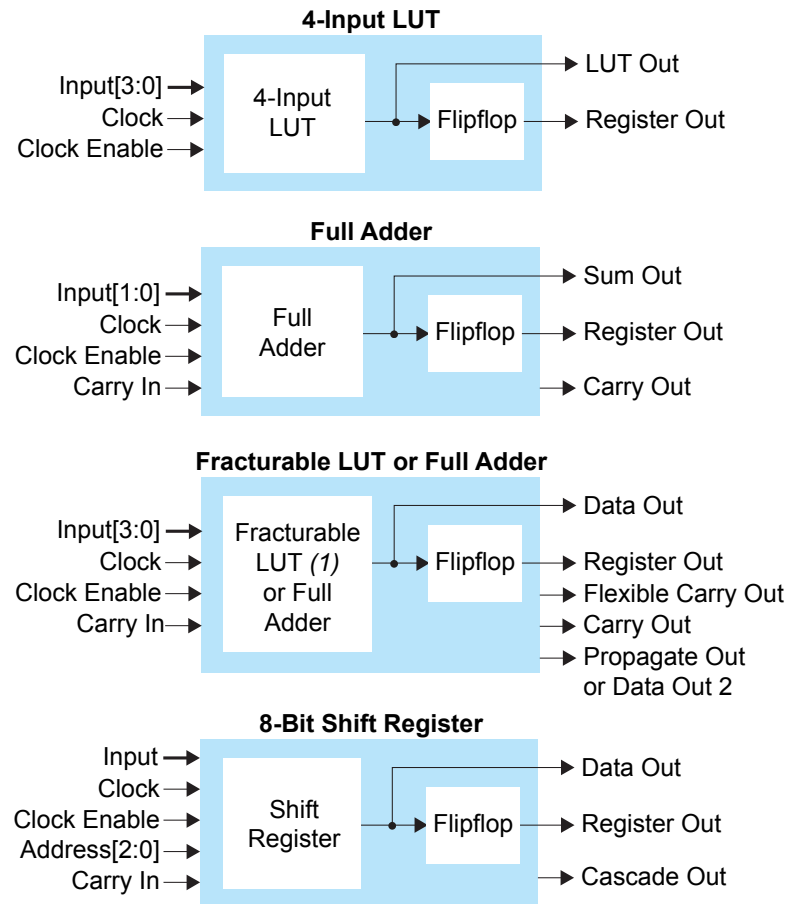

XLR Cell

The XLR cell functions as:

- A 4-input LUT that supports any combinational logic function with four inputs.
- A simple full adder.
- An 8-bit shift register that can be cascaded.
- A fracturable LUT or full adder.

The logic cell includes an optional flipflop. You can configure multiple logic cells to implement arithmetic functions such as adders, subtractors, and counters.

Figure 2: Logic Cell Functions

1. The fracturable LUT is a combination of a 3-input LUT and a 2-input LUT. They share 2 of the same inputs.

XLR cell primitives:

- [EFX_ADD](#) on page 10
- [EFX_COMB4](#) on page 13
- [EFX_FF](#) on page 18
- [EFX_SRL8](#) on page 20

EFX_LUT4

Simple 4-Input LUT ROM

The EFX_LUT4 primitive is a simple 4-input LUT ROM. Leave unused LUT inputs unconnected and set the LUTMASK value so that it does not depend on them. The software generates an error if the LUTMASK depends on an unconnected input.

EFX_LUT4 Ports

Figure 3: EFX_LUT4 Symbol

Table 1: EFX_LUT4 Ports

| Port | Direction | Description |
|------|-----------|-------------|
| I0 | Input | Data in 0. |
| I1 | Input | Data in 1. |
| I2 | Input | Data in 2. |
| I3 | Input | Data in 3. |
| O | Output | Data out. |

EFX_LUT4 Parameters

Table 2: EFX_LUT4 Parameters

| Parameter | Allowed Values | Description |
|-----------|-------------------------------|---------------------|
| LUTMASK | Any 16 bit hexadecimal number | Content of LUT ROM. |

EFX_LUT4 Function

Table 3: EFX_LUT4 Function

| Inputs | | | | Output |
|--------|----|----|----|-------------|
| I3 | I2 | I1 | I0 | O |
| 0 | 0 | 0 | 0 | LUTMASK[0] |
| 0 | 0 | 0 | 1 | LUTMASK[1] |
| 0 | 0 | 1 | 0 | LUTMASK[2] |
| 0 | 0 | 1 | 1 | LUTMASK[3] |
| 0 | 1 | 0 | 0 | LUTMASK[4] |
| 0 | 1 | 0 | 1 | LUTMASK[5] |
| 0 | 1 | 1 | 0 | LUTMASK[6] |
| 0 | 1 | 1 | 1 | LUTMASK[7] |
| 1 | 0 | 0 | 0 | LUTMASK[8] |
| 1 | 0 | 0 | 1 | LUTMASK[9] |
| 1 | 0 | 1 | 0 | LUTMASK[10] |
| 1 | 0 | 1 | 1 | LUTMASK[11] |
| 1 | 1 | 0 | 0 | LUTMASK[12] |
| 1 | 1 | 0 | 1 | LUTMASK[13] |
| 1 | 1 | 1 | 0 | LUTMASK[14] |
| 1 | 1 | 1 | 1 | LUTMASK[15] |

Figure 4: EFX_LUT4 Verilog HDL Instantiation

```

EFX_LUT4 # (

      I3 => din(3),
      O => dout
    );

end architecture Behavioral;
```

EFX_ADD

Simple Full Adder

The EFX_ADD primitive is a simple full adder. The carry-in (CI) and carry-out (CO) connections are dedicated routing between logic cells. Therefore, the first CI in an adder chain must be tied to ground. To access the CO signal through general logic, insert one adder cell to the end of the adder chain to propagate the CO to the sum.

If unused, connect the adder inputs (I1 and I0) to ground.

EFX_ADD Ports

Figure 6: EFX_ADD Symbol

Table 4: EFX_ADD Ports

| Port | Direction | Description |
|------|-----------|-------------|
| I0 | Input | Data in 0. |
| I1 | Input | Data in 1. |
| CI | Input | Carry in. |
| O | Output | Sum out. |
| CO | Output | Carry out. |

EFX_ADD Parameters

Table 5: EFX_ADD Parameters

| Parameter | Allowed Values | Description |
|-------------|----------------|--|
| I0_POLARITY | 0, 1 | 0: Inverting, 1: Non-inverting (default). |
| I1_POLARITY | 0, 1 | 0: Inverting, 1: Non-inverting (default). |

EFX_ADD Function

Table 6: EFX_ADD Function

| Inputs | | | Outputs | |

    )
    port map (
      I0 => din_a(2),
      I1 => din_b(2),
      CI => carry_out(1),
      O => sum(2)
    );

end architecture Behavioral;

```

EFX_COMB4

Simple 4-Input LUT ROM plus Simple Adder

The EFX_COMB4 primitive supports the full capabilities of the Titanium logic cell. The EFX_COMB4 has all the inputs and outputs of the EFX_LUT4 and the EFX_ADD plus two additional outputs, P and FCO. The P output is the internal 4-LUT signal that generates the propagate logic used to calculate carry-out (CO). The FCO is a flexible carry-out signal that can drive normal logic (CO can only drive the CI port of another EFX_COMB4).

EFX_COMB4 Ports

Figure 9: EFX_COMB4 Symbol

Table 7: EFX_COMB4 Ports

| Port | Direction | Description |
|------|-----------|--|
| I0 | Input | Data in 0. |
| I1 | Input | Data in 1. |
| I2 | Input | Data in 2. |
| I3 | Input | Data in 3. |
| CI | Input | Carry in. This port is only fed by dedicated routing from the adjacent logic cell's CO connection. Therefore, tie the first CI in an adder chain to ground. ⁽¹⁾ |
| O | Output | Data out. |
| P | Output | Propagate out. |
| CO | Output | Carry out. Dedicated fast connection to the CI of the neighboring EFX_COMB4 primitive. It passes the inverted value of the carry function. |
| FCO | Output | Flexible carry out. General-purpose output from the EFX_COMB4 that can connect to any block. It passes the un-inverted value of the carry function. |

⁽¹⁾ In the place and route netlist, the CI input is unconnected and treated as GND in the LUTMASK.

EFX_COMB4 Parameters

Table 8: EFX_COMB4 Parameters

| Parameter | Allowed Values | Description |
|-----------|-------------------------------|---|
| LUTMASK | Any 16-bit hexadecimal number | Content of LUT ROM. |
| MODE | LOGIC, ARITH | Indicates if implementing a general logic function or an arithmetic function. |

EFX_COMB4 Function

You can use EFX_COMB4 to map complicated functions that are not supported by EFX_LUT4 or EFX_ADD. For example, you can export the arithmetic propagate signal to implement a carry skip adder in soft logic or pack a 3-input and 2-input function into one logic cell.

The MODE parameter controls whether the EFX_COMB4 is performing general logic (LOGIC) or arithmetic functions (ARITH).

Table 9: EFX_COMB Modes

| Signal | LOGIC Mode | ARITH Mode |
|--------|---|---|
| I0 | Input. | Input. |
| I1 | Input. | Input. |
| I2 | Input. | Unused. |
| I3 | Input. | Unused. |
| O | Is a function of the I3, I2, I1, and I0 inputs. | Is a function of the CI, I1, and I0 inputs. |
| P | Is a function of the I1 and I0 inputs. | Is a function of the I1 and I0 inputs. |
| FCO | Unused. | Is a function of the CI, I1, and I0 inputs. |
| CI | Unused. | Carry in. |
| CO | Unused. | Is a function of the CI, I1, and I0 inputs. |
| Notes | When just using the O output, all 4 inputs are rotatable during routing. When using the O and P outputs, only the I1 and I0 inputs may be rotated during routing. <i>Only a flipflop being driven by the O output may be packed with this cell.</i> | Unlike EFX_ADD, the function of the outputs is dependent on the LUTMASK parameter. The I1 and I0 inputs may be rotated during routing. |

Leave unused inputs unconnected and as a “don't care” in the LUTMASK. The Efinity[®] software issues an error if the LUTMASK depends on an unconnected input. A LUT cannot be driven by the same net on different input ports. Remove any redundant inputs and adjust the LUTMASK appropriately.

Note: EFX_ADD and EFX_COMB4 may not be intermingled in a single adder chain because the CO signal of an EFX_COMB4 is inverting, while the EFX_ADD is not.

Table 10: EFX_COMB4 Function (Logic Mode)

| Inputs | | | | Outputs | |
|--------|----|----|----|-------------|-------------|
| I3 | I2 | I1 | I0 | O | P |
| 0 | 0 | 0 | 0 | LUTMASK[0] | LUTMASK[8] |
| 0 | 0 | 0 | 1 | LUTMASK[1] | LUTMASK[9] |
| 0 | 0 | 1 | 0 | LUTMASK[2] | LUTMASK[10] |
| 0 | 0 | 1 | 1 | LUTMASK[3] | LUTMASK[11] |
| 0 | 1 | 0 | 0 | LUTMASK[4] | LUTMASK[8] |
| 0 | 1 | 0 | 1 | LUTMASK[5] | LUTMASK[9] |
| 0 | 1 | 1 | 0 | LUTMASK[6] | LUTMASK[10] |
| 0 | 1 | 1 | 1 | LUTMASK[7] | LUTMASK[11] |
| 1 | 0 | 0 | 0 | LUTMASK[8] | LUTMASK[8] |
| 1 | 0 | 0 | 1 | LUTMASK[9] | LUTMASK[9] |
| 1 | 0 | 1 | 0 | LUTMASK[10] | LUTMASK[10] |
| 1 | 0 | 1 | 1 | LUTMASK[11] | LUTMASK[11] |
| 1 | 1 | 0 | 0 | LUTMASK[12] | LUTMASK[8] |
| 1 | 1 | 0 | 1 | LUTMASK[13] | LUTMASK[9] |
| 1 | 1 | 1 | 0 | LUTMASK[14] | LUTMASK[10] |
| 1 | 1 | 1 | 1 | LUTMASK[15] | LUTMASK[11] |

Table 11: EFX_COMB4 Function (Arithmetic Mode)

| Inputs | | | Outputs | | |
|--------|----|----|------------|-------------|-------------|
| CI | I1 | I0 | O | PROP | GEN |
| 0 | 0 | 0 | LUTMASK[0] | LUTMASK[8] | LUTMASK[12] |
| 0 | 0 | 1 | LUTMASK[1] | LUTMASK[9] | LUTMASK[13] |
| 0 | 1 | 0 | LUTMASK[2] | LUTMASK[10] | LUTMASK[14] |
| 0 | 1 | 1 | LUTMASK[3] | LUTMASK[11] | LUTMASK[15] |
| 1 | 0 | 0 | LUTMASK[4] | LUTMASK[8] | LUTMASK[12] |
| 1 | 0 | 1 | LUTMASK[5] | LUTMASK[9] | LUTMASK[13] |
| 1 | 1 | 0 | LUTMASK[6] | LUTMASK[10] | LUTMASK[14] |
| 1 | 1 | 1 | LUTMASK[7] | LUTMASK[11] | LUTMASK[15] |

In arithmetic mode, the carry function uses the CI input and the PROP and GEN signals. If the PROP signal is 1, the CI input is propagated to carry; otherwise, the GEN signal is sent to carry.

The CO output is a dedicated fast connection to the CI of neighboring COMB4 primitive. It passes the inverted value of the carry function. The FCO is a general-purpose output from the COMB4 that can connect to any block. It passes the un-inverted value of the carry function.

Table 12: Arithmetic Mode Signals and Outputs

| Signals | | | Outputs | | |
|---------|-----|----|---------|-----|---|
| PROP | GEN | CI | CO | FCO | P |
| 0 | 0 | 0 | 1 | 0 | 0 |
| 0 | 0 | 1 | 1 | 0 | 0 |
| 0 | 1 | 0 | 0 | 1 | 0 |
| 0 | 1 | 1 | 0 | 1 | 0 |
| 1 | 0 | 0 | 1 | 0 | 1 |
| 1 | 0 | 1 | 0 | 1 | 1 |
| 1 | 1 | 0 | 1 | 0 | 1 |
| 1 | 1 | 1 | 0 | 1 | 1 |

EFX_FF

D Flip-flop with Clock Enable and Set/Reset Pin

The basic EFX_FF primitive is a D flip-flop with a clock enable and a set/reset pin that can be either asynchronous or synchronously asserted. You can positively or negatively trigger the clock, clock-enable and set/reset pins.

All input ports must be connected. If you do not use a flip-flop control port, connect it to ground or V_{CC} , depending on the polarity. The software issues a warning if a clock port is set to V_{CC} or ground.

EFX_FF Ports

Figure 12: EFX_FF Symbol

Table 13: EFX_FF Ports

| Port | Direction | Description |
|------|-----------|-------------------------------------|
| D | Input | Input data. |
| CE | Input | Clock Enable. |
| CLK | Input | Clock. |
| SR | Input | Asynchronous/synchronous set/reset. |
| Q | Output | Output data. |

EFX_FF Parameters

Table 14: EFX_FF Parameters

| Parameter | Allowed Values | Description |
|------------------|----------------|--|
| CLK_POLARITY | 0, 1 | 0 falling edge, 1 rising edge (default). |
| CE_POLARITY | 0, 1 | 0 active low, 1 active high (default). |
| SR_POLARITY | 0, 1 | 0 active low, 1 active high (default). |
| D_POLARITY | 0, 1 | 0 inverting, 1 non-inverting (default). |
| SR_SYNC | 0, 1 | 0 asynchronous (default), 1 synchronous. |
| SR_VALUE | 0, 1 | 0 reset (default), 1 set. |
| SR_SYNC_PRIORITY | 1 | Reserved |

EFX_FF Function

When the `SR_SYNC` parameter is asynchronous, the SR port overrides all other ports. When the `SR_SYNC` parameter is synchronous, the SR port is synchronous with the clock and higher priority than the CE port (the SR port takes effect even if CE is disabled).

EFX_SRL8

8-Bit Shift Register

The EFX_SRL8 primitive is an 8-bit shift register with static or dynamic reads. It is controlled by a clock and clock enable, each of which can be positively or negatively triggered.

You must connect all of the EFX_SRL8 input ports. Connect unused EFX_SRL8 control ports to GND or VCC depending on their polarity. The Efinity® software issues a warning if a clock port is set to VCC or GND.

EFX_SRL8 Ports

Figure 15: EFX_SRL8 Symbol

Table 15: EFX_SRL8 Ports

| Port | Direction | Description |
|--------|-----------|---|
| D | Input | Input data. |
| CE | Input | Clock enable. |
| CLK | Input | Clock. |
| A[2:0] | Input | Address of the shift register bit read. |
| Q | Output | Output data inverted value. |
| Q7 | Output | Output of the last bit of the shift register used for cascading (non-inverted). Can only be connected to the D input of another shift register. |

EFX_SRL8 Parameters

Table 16: EFX_SRL8 Parameters

| Parameter | Allowed Values | Description |
|--------------|----------------|-------------------------------------|
| CLK_POLARITY | 0, 1 | 0: Falling edge. 1: Rising edge. |
| CE_POLARITY | 0, 1 | 0: Active-low. 1: Active-high. |
| INIT | 8-bit value | Initial shift register content. |

EFX_SRL8 Function

If the CE port is enabled, the D input value is captured into the first bit of the shift register on the active clock edge; the existing shift register content is shifted by 1. If the CE port is disabled, the value on the D input is ignored and the shift registers maintain their current values.

The inverted bit selected by the address ports A drives the Q output. The first bit is selected by value 3'b111, while the last bit is selected by 2'b000. For a fixed-size shift register, you can drive the A input ports by constant values. To read the shift-register content dynamically, drive the address ports with active signals.

Note: The shift register read is asynchronous to the clock. The eighth bit of the shift register always drives the output Q7. Use it to cascade to another EFX_SRL8 block to implement larger shift registers.

Use the INIT parameter to set the initial content of EFX_SRL8. If unused, EFX_SRL8 initializes to all zeros.

Table 17: EFX_SRL8 Function

| A[2:0] | Q |
|--------|---|
| 111 | 1 |
| 110 | 2 |
| 101 | 3 |
| 100 | 4 |
| 011 | 5 |

EFX_RAM10

10 Kbit RAM Block

The EFX_RAM10 primitive represents a configurable 10 Kbit RAM block⁽²⁾ that supports a variety of widths and depths. All inputs have programmable invert capabilities, allowing positively or negatively triggered control signals.

The memory read and write ports can be configured into various modes for addressing the memory contents. The read and write ports support independently configured data widths.

Table 18: EFX_RAM10 Allowed Read and Write Mode Combinations

| | | Write Mode | | | | | | | |
|---------------------------|-----------|------------|----------|----------|----------|----------|----------|-----------|----------|
| Memory Depth x Data Width | | 512 x 16 | 1024 x 8 | 2048 x 4 | 4096 x 2 | 8192 x 1 | 512 x 20 | 1024 x 10 | 2048 x 5 |
| Read Mode | 512 x 16 | ✓ | ✓ | ✓ | ✓ | ✓ | | | |
| | 1024 x 8 | ✓ | ✓ | ✓ | ✓ | ✓ | | | |
| | 2048 x 4 | ✓ | ✓ | ✓ | ✓ | ✓ | | | |
| | 4096 x 2 | ✓ | ✓ | ✓ | ✓ | ✓ | | | |
| | 8192 x 1 | ✓ | ✓ | ✓ | ✓ | ✓ | | | |
| | 512 x 20 | | | | | | ✓ | ✓ | ✓ |
| | 1024 x 10 | | | | | | ✓ | ✓ | ✓ |
| | 2048 x 5 | | | | | | ✓ | ✓ | ✓ |

The following formula shows how the memory content is addressed for the different data widths.

$$[((ADDR + 1) * WIDTH) - 1 : (ADDR * WIDTH)]$$

You define the initial RAM content using `INIT_N` parameters. There are 40 `INIT_N` parameters, each one represents 256 bits of the memory. The memory space covered by each `INIT_N` parameter uses this formula:

$$[((N + 1) * 256) - 1 : (N * 256)]$$

Used as RAM

When using the EFX_RAM10 primitive as RAM:

- You must connect the control ports (`WCLK`, `WE`, `WCLKE`, `WADDREN`, `RCLK`, `RE`, `RADDREN`, and `RST`). If the ports are unused, connect them to GND or VCC depending on their polarity.
- You can use an optional output register to improve t_{CO} at a cost of one stage of latency. It uses the same clock and read enable as the read port.
- If you use the same clock and clock polarity to control both the read and write ports of the memory, the memory is synchronous; otherwise it is asynchronous.

⁽²⁾ 10 Kbits only available in 1024 x 10 and 2048 x 5 modes.

When writing to a synchronous memory and reading the same address, the read port has these modes:

- **READ_FIRST**—Old memory content is read. (default)
- **WRITE_FIRST**—Write data is passed to read port. To use this mode, **READ_WIDTH** and **WRITE_WIDTH** must be the same and the same signals must drive the **RADDR** and **WADDR** ports.
- **READ_UNKNOWN**—Read data becomes X. Use **READ_UNKNOWN** for asynchronous memory. Write operations ignore the read port, which guarantees that if the same address is written and read at the same time the write succeeds, but the read is undefined. This mode is inferred if the RAM uses two different read and write clocks or if the same clock is used but the HDL behavior is not deterministic.

The **WRITE_MODE** parameter controls the read port behavior.

Only the address lines valid in the mode may be used. Leave all other address lines unconnected. For example, only address bits **WADDR[8:0]** may be used in 512 x 16 write mode. You must connect all address lines for a mode. Connect required, unused address lines to GND. For example if the RAM is in 512 x 16 write mode but is only implementing a 64 x 2 memory address, **WADDR[12:9]** will be unconnected. Connect **WADDR[8:6]** to GND, **WADDR[5:0]** is used..

Leave unused data lines unconnected. For example if the RAM is in 512 x 16 write mode but is only implementing a 64 x 2 memory, **WDATA[19:2]** and **RDATA[19:2]** are unused and unconnected. **WDATA[1:0]** and **RDATA[1:0]** are connected and used.

Used as ROM

When using the **EFX_RAM10** primitive as ROM:

- Connect **WE**, **WCLK**, **WCLKE**, and **WADDREN** to GND.
- Leave **WDATA** unconnected.
- Leave **WADDR** unconnected or connect to GND based on the write width you select.

Note: The write mode must be compatible with the read mode even though the write ports of the ROM are not used. For example, if the ROM is reading in 512 x 16 mode one compatible write mode is 1024 x 8.

The Efinity[®] software issues an error if the read or write clock is constant and issues warnings if the **WE**, **RE**, **WCLKE**, **WADDREN**, **RADDREN**, or **RST** ports are disabled. When implementing a ROM, no errors or warnings are given for the write port if **WCLK**, **WE**, **WADDREN**, and **WCLKE** are disabled.

WADDREN and **RADDREN** are enable ports for the write and read addresses. During normal operation they should be high using the value on the address lines to choose the address for reading or writing. When disabled (low) they act as an address stall and the read or write operation uses the previous address latched into the memory.

Byte Enable Support

The **EFX_RAM10** block supports byte enable if the **WRITE_WIDTH** parameter is 16 or 20. In widths of 16 or 20, **WE[0]** controls writing to the lower half of the data and **WE[1]** controls writing to the upper half of the data.

Reset

The **RST** port can reset the output of the RAM and/or the RAM output register. The **RST_RAM** and **RST_OUTREG** parameters control the behavior.

- **RST_RAM** can be set to **NONE**, **ASYNC** (default), or **SYNC**. If set to **ASYNC**, the RAM output is reset to all 0s asynchronous to the **RCLK**. If it is **SYNC**, the output is reset to all 0s synchronously with the **RCLK**.
- **RST_OUTREG** can be set to **NONE** or **ASYNC** (default). This parameter is ignored if the output register is disabled.

EFX_RAM10 Ports

Figure 18: EFX_RAM10 Symbol

Table 19: EFX_RAM10 Ports

| Port Name | Direction | Description |
|-------------|-----------|-----------------------|
| WDATA[19:0] | Input | Write data. |
| WADDR[12:0] | Input | Write address. |
| WE[1:0] | Input | Write enable. |
| WCLK | Input | Write clock. |
| WCLKE | Input | Write clock enable. |
| WADDREN | Input | Write address enable. |
| RDATA[19:0] | Output | Read data. |
| RADDR[12:0] | Input | Read address. |
| RE | Input | Read enable. |
| RADDREN | Input | Read address enable. |
| RCLK | Input | Read clock. |
| RST | Input | Reset the RAM output. |

EFX_RAM10 Parameters

Table 20: EFX_RAM10 Parameters

Every input port has programmable inversion support defined by `<port name>_POLARITY`.

| Parameter Name | Allowed Values | Description |
|---|----------------------------|---|
| INIT_0, ...INIT_F..., INIT_27 | 256-bit hexadecimal number | Initial RAM content. |
| READ_WIDTH WRITE_WIDTH | 16 | 512 x 16 (default). |
| | 8 | 1,024 x 8. |
| | 4 | 2,048 x 4. |
| | 2 | 4,096 x 2. |
| | 1 | 8,192 x 1. |
| | 20 | 512 x 20. |
| | 10 | 1,024 x 10. |
| | 5 | 2,048 x 5. |
| OUTPUT_REG | 0, 1 | 0: disable output register (default). 1: enable output register. |
| RESET_RAM | NONE | RST signals does not affect the RAM output. |
| | ASYNC | RAM output resets asynchronously to RCLK. |
| | SYNC | RAM output resets synchronously to RCLK. |
| RESET_OUTREG | NONE | RST signals does not affect the RAM output register. |
| | ASYNC | RAM output register resets asynchronously to RCLK. |
| <code><port name>_POLARITY</code> | 0, 1 | 0: Active low 1: Active high (default) |
| WRITE_MODE | READ_FIRST | Old memory content is read. (default). |
| | WRITE_FIRST | Write data is passed to the read port. In this mode WCLKE must be enabled. |
| | READ_UNKNOWN | Read and writes are unsynchronized, therefore, the results of the address can conflict. |

```

.RADDREN    (RADDREN),    // read address enable
.RDATA      (RDATA),      // read data output
.RADDR      (RADDR)       // read address input
);

```

EFX_DPRAM10

10 Kbit True-Dual-Port RAM Block

The EFX_DPRAM10 block represents a 10 Kbit true-dual-port RAM block⁽³⁾ that can be configured to support a variety of widths and depths. All inputs have programmable invert capabilities, which allows you to trigger the control signals positively or negatively.

The memory A and B ports can be configured into several modes for addressing the memory contents. The read and write widths of a single port can be configured to allow writing in one data width while reading another.

The true-dual-port RAM uses the same address bus for reading and writing on a port. Therefore, when a port has mixed widths, the software uses the widest address bus size to determine the address bus width. The direction (read or write) operating in the shallower address size ignores the address bus's LSB because they describe addresses that are outside the legal range for that mode. For example, if reading in 1024 x 8 mode and writing in 2048 x 4 mode the address must be 11 bits wide to be able to address all 2048 words being written. The write data would be 4 bits wide and the read data would be 8 bits wide. Only the upper 10 bits of the address port would be used during reading because it can only read 1024 words from the memory.

Table 21: EFX_DPRAM10 Allowed Read and Write Mode Combinations

| | | Write Mode | | | | | |
|---------------------------|-----------|------------|----------|----------|----------|-----------|----------|
| Memory Depth x Data Width | | 1024 x 8 | 2048 x 4 | 4096 x 2 | 8192 x 1 | 1024 x 10 | 2048 x 5 |
| Read Mode | 1024 x 8 | ✓ | ✓ | ✓ | ✓ | | |
| | 2048 x 4 | ✓ | ✓ | ✓ | ✓ | | |
| | 4096 x 2 | ✓ | ✓ | ✓ | ✓ | | |
| | 8192 x 1 | ✓ | ✓ | ✓ | ✓ | | |
| | 1024 x 10 | | | | | ✓ | ✓ |
| | 2048 x 5 | | | | | ✓ | ✓ |

The following formula shows how the memory content is addressed for the different data widths:

$$[(\text{ADDR} + 1) * \text{WIDTH}] - 1 : (\text{ADDR} * \text{WIDTH})$$

You define the initial content of the RAM using INIT_N parameters. Each INIT_N parameter represents 256 bits of the memory. The 40 INIT_N parameters cover the entire 10K memory content. The memory space covered by each INIT_N parameter uses this formula:

$$[(\text{N} + 1) * 256] - 1 : (\text{N} * 256)$$

Used as RAM

When connecting the ports, use the following guidelines:

⁽³⁾ 10 Kbits only available in 1024 x 10 and 2048 x 5 modes.

- You must connect the BRAM control ports (CLKA, WEA, CLKEA, ADDRENA, RSTA, CLKB, WEB, CLKEB, ADDRENB, RSTB) must be connected. If the ports are unused, connect them to GND or VCC depending on their polarity.
- If you want to disable a RAM port (A or B),
 - Disable all CLK, WE, CLKE, and ADDR ports.
 - WDATA can be disabled or left unconnected.
 - Leave RDATA unconnected.

Each BRAM output port contains an optional output register to improve T_{CO} at a cost of one stage of latency. It uses the same clock signal and clock enable as the port.

When writing to a memory port the behavior of the read port can be one of the following:

- READ_FIRST—Old memory content is read. (default)
- WRITE_FIRST—Write data is passed to read port.
- NO_CHANGE—Previously read data is held.

The WRITE_MODE_A/B parameters control this behavior.

When the same clock and clock polarity is used to control both ports of the memory, the memory is synchronous; otherwise it is asynchronous.

If the same address is read from or written to by both ports, an address collision can occur. The behavior in this situation is:

- If the memory is synchronous and both ports are using WRITE_FIRST mode, you can write to one port and read from the other.
- If both ports write to the same address and the write data is identical, the write succeeds; otherwise the value written is unknown. In WRITE_FIRST mode, there is a special bypass path that guarantees that port will read the same data that is written, even if an address collision occurs.
- If the memory is asynchronous and a read to one port and a write to the other port occurs at the same address, there is an address collision. The write succeeds, and the read data is unknown.

You can only use the address lines that are valid for the mode you are using. For example only address bits ADDR_A [9:0] can be used if port A is in 1024 x 8 mode; all other address lines must be left unconnected. All of the address lines for a mode should be connected. Connect unused, required address lines to GND. Leave all other address lines unconnected. For example if RAM port B is in 1024 x 8 mode but is only implementing a 64 x 2 memory:

- ADDR_B [12:10] are unconnected.
- ADDR_B [9:6] are connected to GND.
- ADDR_B [5:0] are used.

Leave unused data lines unconnected. For example, if the RAM port A is in 1024 x 8 mode but is only implementing a 64 x 2 memory, WDATA_A [19:2] and RDATA_A [19:2] are unused and left unconnected. WDATA_A [1:0] and RDATA_A [1:0] are connected and used.

Used as ROM

When implementing a ROM, connect WEA and WEB to GND. Leave WDATA_A and WDATA_B unconnected or disabled.

Enable

The ADDRENA and ADDRENB are enable ports for the A and B addresses. During normal operation they are high and use the value on the address lines to choose the address for reading and/or writing. When disabled (low) they act as an address stall and the read and/or write operation uses the previous address latched into the memory.

Reset

The RSTA and RSTB ports can reset the output of the RAM and/or the RAM output register. The RST_RAM_A/B and RST_OUTREG_A/B parameters control the behavior. The default value is ASYNC. OUTPUT_REG_A/B is ignored if the output register is not enabled.

EFX_DPRAM10 Ports

Figure 21: EFX_DPRAM10 Symbol

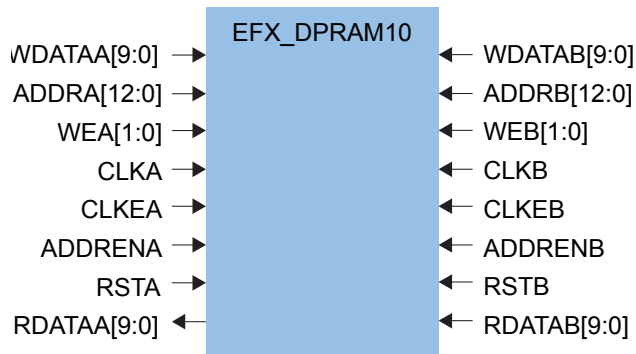

Table 22: EFX_DPRAM10 Ports

| Port Name | Direction | Description |
|----------------------------|-----------|--------------------------|
| WDATAA[9:0] WDATAB[9:0] | Input | Write data port A/B. |
| WEA WEB | Input | Write enable port A/B. |
| ADDRA[12:0] ADDRB[12:0] | Input | Address port A/B. |
| ADDRENA ADDRENB | Input | Address enable port A/B. |
| CLKA CLKB | Input | Clock port A/B. |
| CLKEA CLKEB | Input | Clock enable port A/B. |
| RDATAA[9:0] RDATAB[9:0] | Output | Read data port A/B. |
| RSTA RSTB | Input | Reset port A/B. |

EFX_DPRAM10 Parameters

Table 23: EFX_DPRAM10 Parameters

Every input port has programmable inversion support defined by `<port name>_POLARITY`.

| Parameter Name | Allowed Values | Description |
|---|----------------------------|--|
| INIT_0, ...INIT_F..., INIT_27 | 256 bit hexadecimal number | Initial RAM content (default = 0). |
| READ_WIDTH_A | 8 | 1,024 x 8 (default). |
| READ_WIDTH_B | 4 | 2,048 x 4. |
| WRITE_WIDTH_A | 2 | 4,096 x 2. |
| WRITE_WIDTH_B | 1 | 8,192 x 1. |
| | 10 | 1,024 x 10. |
| | 5 | 2,048 x 5. |
| WRITE_MODE_A | READ_FIRST | Old data is output to RDATA. |
| WRITE_MODE_B | WRITE_FIRST | New data is output RDATA. |
| | NO_CHANGE | RDATA holds its last value. |
| OUTPUT_REG_A | 0, 1 | 0: disable output register (default). |
| OUTPUT_REG_B | | 1: enable output register. |
| RESET_RAM | NONE | RST signals do not affect the RAM output. |
| | ASYNC | RAM output resets asynchronously to RCLK. |
| | SYNC | RAM output resets synchronously to RCLK. |
| RESET_OUTREG | NONE | RST signals do not affect the RAM output register. |
| | ASYNC | RAM output register resets asynchronously to RCLK. |
| <code><port name>_POLARITY</code> | 0, 1 | 0: active low 1: active high (default) |

DSP Block

The Titanium FPGA has high-performance, complex DSP blocks that can perform multiplication, addition, subtraction, accumulation, and 4-bit variable right shifting. The 4-bit variable right shift supports one lane in normal mode, two lanes in dual mode and four lanes in quad mode. Each DSP block has four modes, which support the following multiplication operations:

- *Normal*—One 19×18 integer multiplication with 48-bit addition/subtraction.
- *Dual*—One 11×10 integer multiplication and one 8×8 integer multiplication with two 24-bit additions/subtractions.
- *Quad*—One 7×6 integer multiplication and three 4×4 integer multiplications with four 12-bit additions/subtractions.

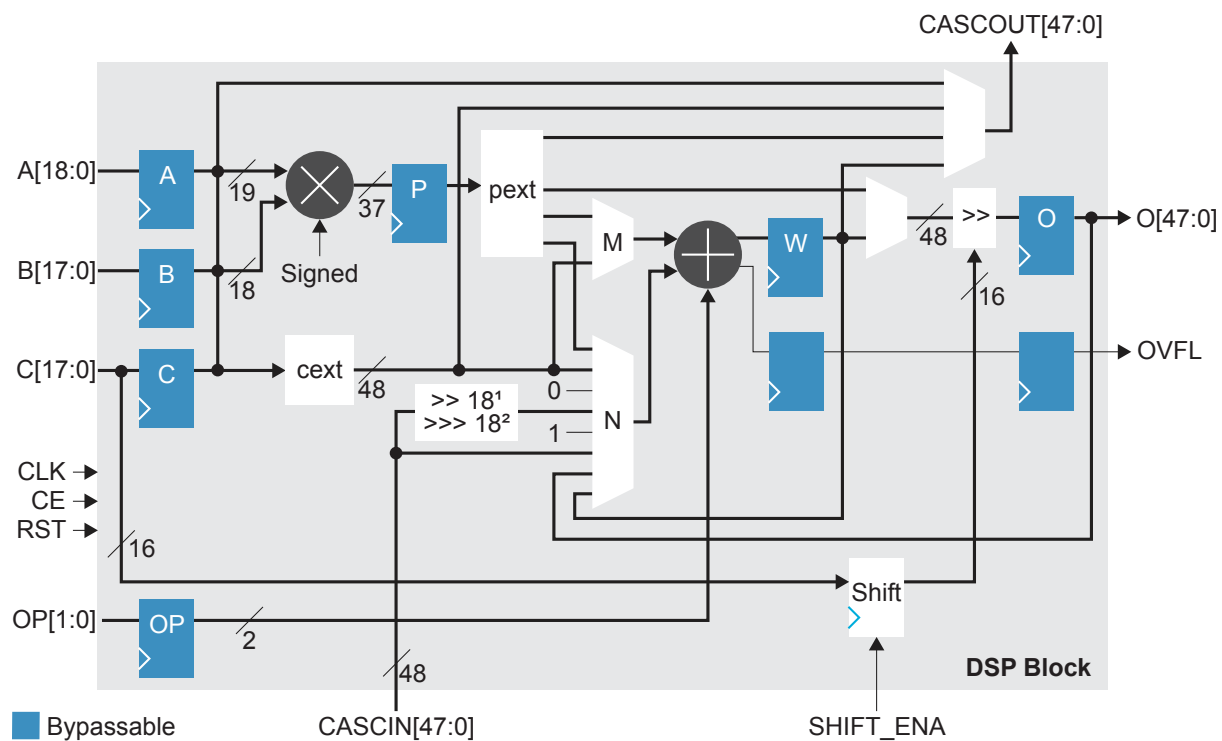

Important: The 7×6 Quad mode output is truncated to 12-bit.

- *Float*—One fused-multiply-add/subtract/accumulate (FMA) BFLOAT16 multiplication.

The integer multipliers can represent signed or unsigned values based on the `SIGNED` parameter. When multiple `EFX_DSP12` or `EFX_DSP24` primitives are mapped to the same DSP block, they must have the same `SIGNED` value. The inputs to the multiplier are the A and B data inputs. Optionally, you can use the result of the multiplier in an addition or subtraction operation.

Figure 24: DSP Block Diagram

1. Logical right-shift-by-18.
2. Arithmetic right-shift-by-18.

Learn more: Refer to the [Quantum® Titanium Primitives User Guide](#) for details on the Titanium DSP block primitives.

DSP Block Modes

The mode of the DSP Block primitive determines how the block interprets data inputs and outputs, and how the block performs extension and shifting functions.

Table 24: Bit Slicing by Mode

| MODE | Multiplier Size | A | B | C | Shift | O |
|--------|-----------------|----------|----------|----------|----------|----------|
| NORMAL | 19 x 18 | A[18:0] | B[17:0] | C[17:0] | C[3:0] | O[47:0] |
| DUAL | 11 x 10 | A[18:8] | B[17:8] | C[17:8] | C[7:4] | O[47:24] |
| | 8 x 8 | A[7:0] | B[7:0] | C[7:0] | C[3:0] | O[23:0] |
| QUAD | 7 x 6 | A[18:12] | B[17:12] | C[17:12] | C[15:12] | O[47:36] |
| | 4 x 4 | A[11:8] | B[11:8] | C[11:8] | C[11:8] | O[35:24] |
| | 4 x 4 | A[7:4] | B[7:4] | C[7:4] | C[7:4] | O[23:12] |
| | 4 x 4 | A[3:0] | B[3:0] | C[3:0] | C[3:0] | O[11:0] |
| BFLOAT | 16 x 16 | A[15:0] | B[15:0] | C[15:0] | N/A | O[47:0] |

Normal Mode

In NORMAL mode the multiplier implements a 19 x 18 integer multiplier with a 37-bit result P. The multiplier may be signed or unsigned depending on the SIGNED parameter. The result is extended to 48 bits.

The C input is 18 bits and is extended to 48 bits based on the C_EXT parameter.

The logical shifter can shift the result 0 to 15 bits to the right. The shift is arithmetic or logical depending on the sign of the DSP Block. The C inputs capture the shift value when the SHIFT_ENA port is asserted.

Dual Mode

In DUAL mode the multiplier implements an 11 x 10 integer multiplier with a 21 bit result and an 8 x 8 integer multiplier with a 16-bit result. The results of both multipliers are extended to 24 bits.

The C input is divided between the two data paths. Each data path is extended to 24 bits based on the C_EXT parameter.

The logical shifter can shift the result 0 to 15 bits to the right. The shift is arithmetic or logical depending on the sign of the DSP Block. The C inputs capture the shift value when the SHIFT_ENA port is asserted.

Quad Mode

In QUAD mode the multiplier implements one 7 x 6 integer multiplier with a 13-bit result and three 4 x 4 integer multipliers with an 8-bit result. The results of the three 4 x 4 multipliers are extended to 12 bits.

The 7 x 6 multiplier's 13-bit result is truncated to 12 bits. If P_EXT is ALIGN_RIGHT, the MSB is removed; if it is ALIGN_LEFT, the LSB is removed.

The C input is divided between the four data paths. Each data path is extended to 12 bits based on the C_EXT parameter.

The logical shifter can shift the result 0 to 15 bits to the right. The shift is arithmetic or logical depending on the sign of the DSP Block. The C inputs capture the shift value when the SHIFT_ENA port is asserted.

BFLOAT Mode

In BFLOAT mode the multiplier implements one fused multiply-add (FMA) function. The A, B, and C inputs are represented as BFLOAT16 while the accumulator and output are represented as FP32. In BFLOAT mode:

- Set the A_REG, B_REG, P_REG, OP_REG, and W_REG parameters to 1.
- If the C input is used, set the C_REG parameter to 1.
- Set M_SEL to P.
- Set N_SEL to CONST0, C, CASCIN, or W.
- Set W_SEL to ADD_SUB.
- Set CASCOUT_SEL to W or ABC. If set to ABC the A, B, and C inputs are expected to be capturing the 33-bit internal FP32 representation expected by the adder.
- Set the P_EXT and C_EXT parameters to ALIGN_RIGHT.

The shifter is bypassed.

The O output is in FP32 mode:

- Bits [47:43] carry the error flags {INVALID, INFINITE, OVERFLOW, UNDERFLOW, INEXACT},.
- Bits [42:32] are unused.
- Bits [31:0] are the FP32 representation.

The USE_CE and USE_RST parameters are only valid for the A, B, C, OP, and O registers. They are ignored for the P and W registers.

Cascading Blocks

When the CASCIN or CASCOUT ports are used to chain DSP blocks the bit-slicing of the data matches the output port O. All DSP Blocks in a chain must be in the same mode.

DSP Block Primitives

The Efinity[®] software has three primitives to support the Titanium DSP Block:

- *EFX_DSP48*—Supports the full functionality of the DSP block in all modes (NORMAL, BFLOAT, DUAL, and QUAD)
- *EFX_DSP24*—Supports one 8 x 8 multiplier in DUAL mode.
- *EFX_DSP12*—Supports one 4 x 4 multiplier in QUAD mode.

EFX_DSP48

Full Function DSP Block

The EFX_DSP48 primitive models the full functionality of the DSP block in all modes (NORMAL, BFLOAT, DUAL, and QUAD). In DUAL or QUAD modes, the physical arrangement of the individual data paths must be considered as well as special handling of the MSB data bits.

Auto-Instantiation and Compilation

The DSP packing is done automatically by the Efinity software. Efinity packs 2 DSP24 blocks or at maximum of 4 DSP12 blocks under the same clock and reset signal into a single DSP48 resource. Mixing DSP24 and DSP12 packing is not allowed.

You can instantiate DSP48 in DUAL or QUAD mode for manual packing.

Manual DSP Instantiation

The manual DSP instantiation is carried out in the following modes:

Table 27: Dual Mode

| Multiplier | Input | Output |
|------------|--------------------|---|
| 11 x 10 | A[18:8] B[17:8] | O[47:24] Output sign: Extended to 24-bits. |
| 8 x 8 | A[7:0] B[7:0] | O[23:0] Output sign: Extended to 24-bits. |

Table 28: Quad Mode

| Multiplier | Input | Output |
|------------|----------------------|--|
| 7 x 6 | A[18:12] B[17:12] | O[47:36] Output sign: Extended to 12-bits. |
| | |  Important: The output is 12-bit only. A 13-bit output is truncated to 12-bit, hence the maximum range for calculation is limited. |
| 4 x 4 | A[11:8] B[11:8] | O[35:24] Output sign: Extended to 12-bits. |
| 4 x 4 | A[7:4] B[7:4] | O[23:12] Output sign: Extended to 12-bits. |
| 4 x 4 | A[3:0] B[3:0] | O[11:0] Output sign: Extended to 12-bits. |

EFX_DSP48 Ports

Figure 25: EFX_DSP48 Symbol

Table 29: EFX_DSP48 Ports

| Port Name | Direction | Description |
|---------------|-----------|--|
| A[18:0] | Input | Operand A. |
| B[17:0] | Input | Operand B. |
| C[17:0] | Input | Operand C. |
| OP[1:0] | Input | Add/subtract function control. 00: M + N 01: M - N 10: -M + N 11: -M - N |
| SHIFT_ENA | Input | Load the shifter register S from the C input. |
| CASCIN[47:0] | Input | Dedicated input from the DSP block below. |
| CLK | Input | Clock. |
| CE | Input | Clock enable. |
| RST | Input | Set/reset. |
| O[47:0] | Output | DSP output. |
| CASCOUT[47:0] | Output | Dedicated output to the DSP block above. |
| OVFL | Output | Overflow/underflow flag. Signed—The operation behaves as you would expect. Unsigned—Internally, the operation is performed using signed arithmetic. When OP is 00, the operation behaves as you would expect. For the other operands, it reports overflow or underflow if information is lost during the operation. When using dual or quad mode, the overflow bits are calculated independently and ORed together. |

Add/subtract behavior depends on the mode and sign:

- In BFLOAT mode, all 4 add/subtract functions are available.
- In an integer mode (NORMAL, DUAL, or QUAD) the 00, 01, and 10 functions operate as expected, but 11 performs -M-N-1.

EFX_DSP48 Parameters

Table 30: EFX_DSP48 Parameters

Every input port has programmable inversion support defined by `<name>_POLARITY`.

| Parameter Name | Allowed Values | Description |
|----------------|----------------|--|
| MODE | NORMAL | One 19 x 18 integer multiply. |
| | DUAL | One 11 x 10 and one 8 x 8 integer multiply. |
| | QUAD | One 7 x 6 and three 4 x 4 integer multiplies. |
| | BFLOAT | One 16 x 16 BFLOAT16. |
| A_REG | 0, 1 | 1: Enable A registers. 0: Disabled. |
| A_REG_USE_CE | 0, 1 | 1: A register uses the CE pin. 0: Disabled. |
| A_REG_USE_RST | 0, 1 | 1: A register uses the RST pin. 0: Disabled. |
| B_REG | 0, 1 | 1: Enable B registers. 0: Disabled. |
| B_REG_USE_CE | 0, 1 | 1: B register uses the CE pin. 0: Disabled. |
| B_REG_USE_RST | 0, 1 | 1: B register uses the RST pin. 0: Disabled. |
| C_REG | 0, 1 | 1: Enable C registers. 0: Disabled. |
| C_REG_USE_CE | 0, 1 | 1: C register uses the CE pin. 0: Disabled. |
| C_REG_USE_RST | 0, 1 | 1: C register uses the RST pin. 0: Disabled. |
| OP_REG | 0, 1 | 1: Enable OP register. 0: Disabled. |
| OP_REG_USE_CE | 0, 1 | 1: OP register uses the CE pin. 0: Disabled. |
| OP_REG_USE_RST | 0, 1 | 1: OP register uses the RST pin. 0: Disabled. |
| P_REG | 0, 1 | 1: Enable P registers. 0: Disabled. |
| P_REG_USE_CE | 0, 1 | 1: P register uses the CE pin. 0: Disabled. |
| P_REG_USE_RST | 0, 1 | 1: P register uses the RST pin. 0: Disabled. |
| W_REG | 0, 1 | 1: Enable W registers. 0: Disabled. |

| Parameter Name | Allowed Values | Description |
|----------------|---|---|
| W_REG_USE_CE | 0, 1 | 1: W register uses the CE pin. 0: Disabled. |
| W_REG_USE_RST | 0, 1 | 1: W register uses the RST pin. 0: Disabled. |
| O_REG | 0, 1 | 1: Enable output registers. 0: Disabled. |
| O_REG_USE_CE | 0, 1 | 1: O register uses the CE pin. 0: Disabled. |
| O_REG_USE_RST | 0, 1 | 1: O register uses the RST pin. 0: Disabled. |
| SHIFTER | 0, 1 | 1: Enables output shifting. When using output shifting: <ul style="list-style-type: none"> • If you bypass the adder, disable W_REG and enable O_REG • If you use the adder, enable both W_REG and O_REG 0: Disables output shifting (default). |
| RST_SYNC | 0, 1 | 1: Synchronous. 0: Asynchronous. |
| SIGNED | 0, 1 | 1: Signed arithmetic. 0: Unsigned. Ignored in BFLOAT mode. |
| P_EXT | ALIGN_LEFT, ALIGN_RIGHT | Extends the multiplier output to 48 bits. ALIGN_RIGHT: The MSB is sign-extended or zero-extended based on the MODE and SIGNED value. ALIGN_LEFT: The LSB is zero-extended. |
| C_EXT | ALIGN_LEFT, ALIGN_RIGHT | This extends the multiplier output to 48-bits. ALIGN_RIGHT: The MSB is sign-extended or zero-extended based on the MODE and SIGNED value. ALIGN_LEFT: The LSB is zero-extended. |
| M_SEL | P, C | Selects the data for the M input to the add/sub block. ABC: Lower 16 bits of the A, B, and C inputs. C: Input C. P: Multiplier output. |
| N_SEL | CONST0, CONST1, C, P, CASCIN, CASCIN_ASR18, CASCIN_LSR18, W, O | Selects the data for the N input to the add/sub block. CONST0/1: Chooses a constant 0 or 1. In DUAL and QUAD modes, the 1 is passed to each slice value; C: Input C. P: Multiplier output; CASCIN: CASCIN input; CASCIN_ASR18: CASCIN input, but does an arithmetic shift it right by 18 bits. Only legal in NORMAL mode. CASCIN_LSR18: CASCIN input, but does a logical shift it right by 18 bits. Only legal in NORMAL mode. W: Input to the logical shifter. If selected, enable the W register. O: DSP output. If selected, enable the O and W registers. |
| W_SEL | P, X | Selects the data for the logical shifter. P: Multiplier output. X: Add/sub output. |

| Parameter Name | Allowed Values | Description |
|-------------------------|----------------|---|
| CASCOUT_SEL | C, P, W, ABC | <p>Selects the data for the CASCOUT output.</p> <p>ABC: Lower 16 bits of the A, B, and C inputs.</p> <p>C: C input. Illegal in BFLOAT mode.</p> <p>P: Multiplier output. Illegal in BFLOAT mode.</p> <p>W: Input to the logical shifter. When set to W, you cannot bypass the adder.</p> <p>CASCOUT_SEL is legal in NORMAL, DUAL, and QUAD modes. Allows you to pass in a full CASCIN result.</p> <p>With some external logic, allows a DSP CASCOUT to represent an FP32 number {a[15:0], b[15:0], c[15:0]}</p> |
| ROUNDING ⁽⁴⁾ | RTZ | Round towards zero. |
| | RUP | Round up. |
| | RDOWN | Round down. |
| | RNI | Round nearest, ties to infinity. |
| | RTO | Round to odd. |
| | RNE | Round nearest, ties to even. |
| <name>_POLARITY | 0, 1 | <p>1: Active high</p> <p>0: Active low.</p> |

⁽⁴⁾ ROUNDING is only used in BFLOAT mode.

EFX_DSP48 Function

The EFX_DSP48 is a signed integer multiplier.

Figure 26: EFX_DSP48 Verilog HDL Instantiation

EFX_DSP24

Dual-Mode 8 x 8 DSP Block

The EFX_DSP24 primitive can model the functionality of one 8 x 8 multiplier in DUAL mode. The placer can place two EFX_DSP24 primitives in one DSP block. The placer is responsible for sign or zero extending the MSB bits of the EFX_DSP24 placed in the top location.

DSP24 Properties

The EFX_DSP24 primitive is automatically packed and placed into the DSP block in DUAL mode, and supports a maximum width of 8 x 8.

You must use the EFX_DSP48 primitive if you want to use the 11 x 10 format in the MSB lane in DUAL mode.

EFX_DSP24 Ports

Figure 28: EFX_DSP24 Symbol

Table 31: EFX_DSP24 Ports

| Port Name | Direction | Description |
|---------------|-----------|---|
| A[7:0] | Input | Operand A. |
| B[7:0] | Input | Operand B. |
| C[7:0] | Input | Operand C. |
| OP[1:0] | Input | Add/subtract function control 00: M + N 01: M - N 10: -M + N 11: -M - N |
| SHIFT_ENA | Input | Load the shifter register S from the C input. |
| CASCIN[23:0] | Input | Dedicated input from the DSP block below. |
| CLK | Input | Clock. |
| CE | Input | Clock enable. |
| RST | Input | Set/reset. |
| O[23:0] | Output | DSP output. |
| CASCOUT[23:0] | Output | Dedicated output to the DSP block above. |

The add/subtract behavior for 00, 01, and 10 functions operate as expected, but 11 performs $-M-N-1$.

EFX_DSP24 Parameters

Table 32: EFX_DSP24 Parameters

Every input port has programmable inversion support defined by `<name>_POLARITY`.

| Parameter Name | Allowed Values | Description |
|----------------|----------------|---|
| A_REG | 0, 1 | 1: Enable A registers. 0: Disabled. |
| A_REG_USE_CE | 0, 1 | 1: A register uses the CE pin. 0: Disabled. |
| A_REG_USE_RST | 0, 1 | 1: A register uses the RST pin. 0: Disabled. |
| B_REG | 0, 1 | 1: Enable B registers. 0: Disabled. |
| B_REG_USE_CE | 0, 1 | 1: B register uses the CE pin. 0: Disabled. |
| B_REG_USE_RST | 0, 1 | 1: B register uses the RST pin. 0: Disabled. |
| C_REG | 0, 1 | 1: Enable C registers. 0: Disabled. |

| Parameter Name | Allowed Values | Description |
|----------------|----------------------------|---|
| C_REG_USE_CE | 0, 1 | 1: C register uses the CE pin. 0: Disabled. |
| C_REG_USE_RST | 0, 1 | 1: C register uses the RST pin. 0: Disabled. |
| OP_REG | 0, 1 | 1: Enable OP register. 0: Disabled. |
| OP_REG_USE_CE | 0, 1 | 1: OP register uses the CE pin. 0: Disabled. |
| OP_REG_USE_RST | 0, 1 | 1: OP register uses the RST pin. 0: Disabled. |
| P_REG | 0, 1 | 1: Enable P registers. 0: Disabled. |
| P_REG_USE_CE | 0, 1 | 1: P register uses the CE pin. 0: Disabled. |
| P_REG_USE_RST | 0, 1 | 1: P register uses the RST pin. 0: Disabled. |
| W_REG | 0, 1 | 1: Enable W registers. 0: Disabled. |
| W_REG_USE_CE | 0, 1 | 1: W register uses the CE pin. 0: Disabled. |
| W_REG_USE_RST | 0, 1 | 1: W register uses the RST pin. 0: Disabled. |
| O_REG | 0, 1 | 1: Enable output registers. 0: Disabled. |
| O_REG_USE_CE | 0, 1 | 1: O register uses the CE pin. 0: Disabled. |
| O_REG_USE_RST | 0, 1 | 1: O register uses the RST pin. 0: Disabled. |
| SHIFTER | 0, 1 | 1: Enables output shifting. When using output shifting: <ul style="list-style-type: none"> • If you bypass the adder, disable W_REG and enable O_REG • If you use the adder, enable both W_REG and O_REG 0: Disables output shifting (default). |
| RST_SYNC | 0, 1 | 1: Synchronous. 0: Asynchronous. |
| SIGNED | 0, 1 | 1: Signed arithmetic. 0: Unsigned. |
| P_EXT | ALIGN_LEFT, ALIGN_RIGHT | Extends the multiplier output to 24 bits. ALIGN_RIGHT: The MSB is sign-extended or zero-extended based on the MODE and SIGNED value. ALIGN_LEFT: The LSB is zero-extended. |
| C_EXT | ALIGN_LEFT, ALIGN_RIGHT | This extends the multiplier output to 24-bits. ALIGN_RIGHT: The MSB is sign-extended or zero-extended based on the MODE and SIGNED value. ALIGN_LEFT: The LSB is zero-extended. |

| Parameter Name | Allowed Values | Description |
|-----------------|--|--|
| M_SEL | P, C | Selects the data for the M input to the add/sub block. C: Input C. P: Multiplier output. |
| N_SEL | CONST0, CONST1, C, P, CASCIN, W, or O | Selects the data for the N input to the add/sub block. CONST0/1: Chooses a constant 0 or 1. C: Input C. P: Multiplier output; CASCIN: CASCIN input; W: Input to the logical shifter. If selected, enable the W register. O: DSP output. If selected, enable the O and W registers. |
| W_SEL | P, X | Selects the data for the logical shifter. P: Multiplier output. X: Add/sub output. |
| CASCOUT_SEL | C, P, W, ABC | Selects the data for the CASCOUT output. ABC: Lower 8-bits of the A, B, and C inputs. C: C input. P: Multiplier output. W: Logical shifter input. When set to W, you cannot bypass the adder. |
| <name>_POLARITY | 0, 1 | 0: Active low. 1: Active high. |

EFX_DSP24 Function

The EFX_DSP24 is a signed integer multiplier.

Figure 29: EFX_DSP24 Verilog HDL Instantiation

EFX_GBUFCE

Global Clock Buffer

The EFX_GBUFCE logic block represents the global clock buffer driving the global or regional clock network. The CE port gates the clock and is active high.

You must connect all EFX_GBUFCE input ports. If you do not use a port, connect it to ground or V_{CC} depending on its polarity. The software issues an error if the clock input I is set to V_{CC} or ground.

You can use an EFX_GBUFCE to gate a clock with the clock enable pin.

EFX_GBUFCE Ports

Figure 34: EFX_GBUFCE Symbol

Table 35: EFX_GBUFCE Ports

| Port Name | Direction | Description |
|-----------|-----------|--------------|
| I | Input | Input data |
| CE | Input | Clock enable |
| O | Output | Output data |

EFX_GBUFCE Parameters

Table 36: EFX_GBUFCE Parameters

| Parameter Name | Allowed Values | Description |
|----------------|----------------|---------------------------------------|
| CE_POLARITY | 0, 1 | 0 active low, 1 active high (default) |

EFX_GBUFCE Function

The function table assumes all inputs are active-high polarity.

Table 37: EFX_GBUFCE Function

| Inputs | | Output |
|--------|---|--------|
| CE | I | O |
| 0 | X | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 1 |

Figure 35: EFX_GBUFCE Verilog HDL Instantiation

```
EFX_GBUFCE # (
  _CE_POLARITY(1'b1) // 0 active low, 1 active high
) EFX_GBUFCE_inst (
  .O(O), // Clock output to global clock network
  .I(I), // Clock input
  .CE(CE) // Clock gate
);
```

Interface Primitives

The interface primitives represent the functionality of the blocks that interface between the core and, for some primitives, the package pins (or pads). These primitives are the essential building blocks for the interfaces. They connect to the core primitives through a signal interface.

Figure 37: Interface Primitives

Important: The Efinity software v2025.1 only supports a subset of the possible interface primitives. Additional primitives will be supported in upcoming releases.

Table 38: Primitive Support by Version

| Efinity Version | Supported Primitives |
|-----------------------|---|
| 2024.2 (full release) | EFX_IBUF, EFX_OBUF, EFX_IO_BUF, EFX_CLKOUT, EFX_IREG, EFX_OREG, EFX_IOREG, EFX_IDDIO, EFX_ODDIO, EFX_JTAG_CTRL, EFX_JTAG_V1 EFX_GPIO_V3, EFX_PLL_V3, EFX_FPLL_V1, OSC_V3 |
| 2025.1 (full release) | All primitives supported in v2024.2. EFX_LVDS_RX_V2, EFX_LVDS_TX_V2, EFX_LVDS_BIDIR_V2 |

EFX_IBUF

Single-Ended Input Buffer

The input buffer receives a signal from the GPIO input pad.

EFX_IBUF Ports

Figure 38: EFX_IBUF Symbol

Table 39: EFX_Ports

| Port | Direction | Description |
|------|-----------|--------------------------------|
| I | Input | GPIO pad used for input only. |
| O | Output | Output connection to the core. |

EFX_IBUF Parameters

Table 40: EFX_IBUF Parameters

| Parameter | Allowed Values | Description |
|-------------|--------------------------------------|---|
| PULL_OPTION | NONE WEAK_PULLUP WEAK_PULLDOWN | The type of pullup used on the input. NONE: Disable any internal pull-up or pull-down resistor (Default) WEAK_PULLUP: Enable the weak pull-up resistor WEAK_PULLDOWN: Enable the weak pull-down resistor |

EFX_IBUF Function

Use these examples to instantiate the buffer.

Figure 39: EFX_IBUF Verilog HDL Instantiation

```
EFX_IBUF # (
  _PULL_OPTION("NONE") // "NONE" (Default), "WEAK_PULLUP" , "WEAK_PULLDOWN"
) EFX_IBUF_inst (

    );
end architecture Behavioral;
```

EFX_OBUF

Single-Ended Output Buffer

This simple output buffer sends a signal to the GPIO output pad. If you need an output enable signal, use the [EFX_IO_BUF](#) on page 70 primitive and do not enable the optional input signal.

EFX_OBUF Ports

Figure 41: EFX_OBUF Symbol

Table 41: EFX_OBUF Ports

| Port | Direction | Description |
|------|-----------|---------------------------------|
| I | Input | Input connection from the core. |
| O | Output | GPIO pad used as the output. |

EFX_OBUF Parameters

None.

EFX_OBUF Function

Use these examples to instantiate the output buffer.

Figure 42: EFX_OBUF Verilog HDL Instantiation

```
EFX_OBUF EFX_OBUF_inst (
    .I(I), // Buffer input
    .O(O) // Buffer output (connect to top-level port)

        );
end architecture Behavioral;
```

EFX_IO_BUF

Single-Ended Bi-Directional Buffer

This buffer sends and receives signals to and from the GPIO pad in inout mode. Use this primitive if you need an output enable.

EFX_IO_BUF Ports

Figure 44: EFX_IO_BUF Symbol

Table 42: EFX_IO_BUF Ports

| Port | Direction | Description |
|------|-----------|---|
| I | Input | Output connection from the core. |
| O | Output | Optional input connection to the core. |
| OE | Input | Output enable connection from the core. |
| IO | Inout | GPIO pad used in inout mode. |

EFX_IO_BUF Parameters

Table 43: EFX_IO_BUF Parameters

| Parameter | Allowed Values | Description |
|-------------|--------------------------------------|---|
| PULL_OPTION | NONE WEAK_PULLUP WEAK_PULLDOWN | The type of pullup used on the input. NONE: Disable any internal pull-up or pull-down resistor (Default) WEAK_PULLUP: Enable the weak pull-up resistor WEAK_PULLDOWN: Enable the weak pull-down resistor |

EFX_IO_BUF Function

Use these example to instantiate the I/O buffer.

Figure 45: EFX_IO_BUF Verilog HDL Instantiation

```
EFX_IO_BUF# (
  _PULL_OPTION("NONE") // "NONE" (Default), "WEAK_PULLUP" , "WEAK_PULLDOWN"
) EFX_IO_BUF_inst (
  .I(I), // Buffer input
  .OE(OE), // Enable output, high=output, low=input
  .O(O), // Buffer output
  .IO(IO) // Buffer inout port (Connect to top-level port)
);
```

EFX_GPIO_V3

HVIO and HSIO Used as GPIO

This primitive represents the functionality of the HVIO and HSIO when used as GPIO. The HVIO support a subset of the ports and parameters described in this primitive.

Learn more: Refer to the data sheet for the complete description of the HVIO or HSIO functionality and features. This user guide only describes the primitive ports and parameters.

EFX_GPIO_V3 Ports

Figure 71: EFX_GPIO_V3 Symbol

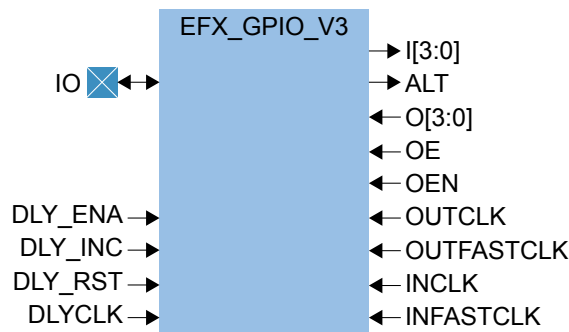

Table 60: EFX_GPIO_V3 Ports

| Port | Direction | Description |
|--------|-----------|---|
| I[3:0] | Output | Input data from the pad to the core fabric. I[0] is the normal input to the core. In DDIO mode, I[0] is the data captured on the positive clock edge (HI pin name in the Interface Designer) and I[1] is the data captured on the negative clock edge (LO pin name in the Interface Designer). When using the deserializer, the first bit is on I[0] and the last bit is on I[3]. |
| ALT | Output | Alternative input connection for GCLK, PLL_CLKIN, RCLK, PLL_EXTFB, and VREF. (In the Interface Designer, Register Option is none). |
| O[3:0] | Input | Output data to GPIO pad from the core fabric. O[0] is the normal output from the core. In DDIO mode, O[0] is the data output on the positive clock edge (HI pin name in the Interface Designer) and O[1] is the data output on the negative clock edge (LO pin name in the Interface Designer). When using the serializer, the first bit is on O[0] and the last bit is on O[3]. |
| OE/OEN | Input | Output enable from core fabric to the I/O block. Can be registered. OEN is used in differential mode. Drive it with the same signal as OE. |

| Port | Direction | Description |
|------------|-----------|--|
| DLYCLK | Input | Delay clock for dynamic delay, sampled on the negative edge. In serializer mode, this clock must be the same clock as INCLK. |
| DLY_ENA | Input | (Optional) Enable the dynamic delay control. |
| DLY_INC | Input | (Optional) Dynamic delay control. When DLY_ENA = 1, 1: Increments 0: Decrements The updated delay count takes effect approximately 5 ns after the rising edge of the clock. |
| DLY_RST | Input | (Optional) Reset the delay counter. |
| OUTCLK | Input | Core clock that controls the output and OE registers. This clock is not visible in the user netlist. |
| OUTFASTCLK | Input | Core clock that controls the output serializer. |
| INCLK | Input | Core clock that controls the input registers. This clock is not visible in the user netlist. |
| INFASTCLK | Input | Core clock that controls the input serializer. |

Table 61: EFX_GPIO_V3 Pads

| Signal | Direction | Description |
|--------------|---------------|-------------|
| IO (P and N) | Bidirectional | GPIO pad. |

EFX_GPIO_V3 Parameters

Table 62: EFX_GPIO_V3 Parameters

| Parameter | Allowed Values | Description |
|--------------------|---|---|
| MODE | INPUT, OUTPUT, INOUT, CLKOUT | The GPIO direction or clock mode. |
| OUT_REG | BYPASS, REG, DDIO, DDIO_RESYNC, SERIAL | Bypass (default), register, inverted register, or use DDIO for the output. |
| IN_REG | BYPASS, REG, DDIO, DDIO_RESYNC, DDIO_PIPE, SERIAL | Bypass (default), register, or use DDIO for the input. |
| OE_REG | BYPASS, REG | Bypass (default) or register the output enable. |
| PULL_OPTION | NONE, WEAK_PULLUP, WEAK_PULLDOWN | The pull direction, if any. NONE: Default |
| IS_OUTCLK_INVERTED | 0, 1 | Specifies whether the output clock is inverted. 0: Not inverted (default) 1: Inverted |
| IS_INCLK_INVERTED | 0, 1 | Specifies whether the input clock is inverted. 0: Not inverted (default) 1: Inverted |
| CONNECTION_TYPE | NORMAL, GCLK, GCTRL, PLL_CLKIN, PLL_EXTFB, MIPI_CLKIN, VREF | The alternate connection type. Used with the ALT port. NORMAL: Default |

| Parameter | Allowed Values | Description |
|------------------|---|--|
| SCHMITT_TRIGGER | 0, 1 | Specifies whether to use the Schmitt trigger. 0: Do not use (default) 1: Use |
| DRIVE_STRENGTH | 2, 4, 6, 8, 10, 12, 16 | Indicates drive strength level. 2: Default |
| SLEW_RATE | 0, 1 | Specifies whether to turn on slew rate. 0: Turn off (default) 1: Turn on |
| BUS_HOLD | 0, 1 | Specifies whether to turn on bus hold. 0: Turn off (default) 1: Turn on |
| INDELAY | 0 - 63 | Static input delay setting. Single ended: 0 - 15 only. Approximately 60 ps of delay per step. Differential: 0 - 63. Approximately 25 ps of delay per step. |
| OUTDELAY | 0 - 63 | Output delay setting. Each step adds approximately 60 ps of delay. |
| INDELAY_DYN_MODE | 0, 1 | Specifies whether to turn on dynamic delay. 0: Turn off (default) 1: Turn on |
| IO_STANDARD | 1.2_V_Differential_HSTL 1.2_V_Differential_SSTL 1.2_V_HSTL 1.2_V_LVCMOS 1.2_V_SSTL 1.35_V_Differential_SSTL 1.35_V_SSTL 1.5_V_Differential_HSTL 1.5_V_Differential_SSTL 1.5_V_HSTL 1.5_V_LVCMOS 1.5_V_SSTL 1.8_V_Differential_HSTL 1.8_V_Differential_SSTL 1.8_V_HSTL 1.8_V_LVCMOS 1.8_V_SSTL 2.5_V_LVCMOS 3.0_V_LVCMOS 3.0_V_LVTTL 3.3_V_LVCMOS 3.3_V_LVTTL | Indicates the I/O standard for the GPIO. |

EFX_LVDS_RX_V2

LVDS Receiver

This primitive represents the functionality of the HSIO when used as an LVDS receiver.

Learn more: Refer to the data sheet for the complete description of the LVDS functionality and features. This user guide only describes the primitive ports and parameters.

EFX_LVDS_RX_V2 Ports

Figure 74: EFX_LVDS_RX_V2 Symbol

Table 63: EFX_LVDS_RX_V2 Ports

| Signal | Direction | Clock Domain | Description |
|------------|-----------|--------------------|--|
| I[9:0] | Output | SLOWCLK | Parallel input data to the core. The width is programmable. |
| ALT | Output | - | Alternate input, only available for an LVDS RX resource in bypass mode (deserialization width is 1; alternate connection type). Alternate connections are PLL_CLKIN, PLL_EXTFB, GCLK, and RCLK. |
| SLOWCLK | Input | - | Parallel (slow) clock. |
| FASTCLK | Input | - | Serial (fast) clock. |
| FIFO_EMPTY | Output | FIFOCLK | This signal is required when you turn on the Enable Clock Crossing FIFO option. Indicates that the FIFO is empty. |
| FIFOCLK | Input | - | This signal is required when you turn on the Enable Clock Crossing FIFO option. Core clock to read from the FIFO. |
| FIFO_RD | Input | FIFOCLK | This signal is required when you turn on the Enable Clock Crossing FIFO option. Enables FIFO to read. |
| RST | Input | FIFOCLK SLOWCLK | (Optional) This signal is available when deserialization is enabled. Asynchronous. Resets the FIFO and deserializer. If the FIFO is enabled, it is relative to FIFOCLK; otherwise it is relative to SLOWCLK. |
| ENA | Input | - | Dynamically enable or disable the LVDS input buffer. Can save power when disabled. 1: Enabled 0: Disabled |

| Signal | Direction | Clock Domain | Description |
|----------|-----------|--------------|---|
| TERM | Input | - | The signal is available when dynamic termination is enabled. Enables or disables termination in dynamic termination mode. 1: Enabled 0: Disabled |
| LOCK | Output | - | (Optional) This signal is available when you set Delay Mode to dpa . Indicates that the DPA has achieved training lock and data can be passed. |
| DLY_ENA | Input | SLOWCLK | This signal is required when you set Delay Mode to dynamic or dpa . Enable the dynamic delay control or the DPA circuit, depending on the LVDS RX delay settings. |
| DLY_INC | Input | SLOWCLK | This signal is required when you set Delay Mode to dynamic . Dynamic delay control. Cannot be used with DPA enabled. When DLY_ENA is 1: 1: Increments 0: Decrements |
| DLY_RST | Input | SLOWCLK | (Optional) This signal is available when you set Delay Mode to dpa or dynamic . Reset the delay counter or the DPA circuit, depending on the LVDS RX delay settings. |
| DBG[5:0] | Output | SLOWCLK | DPA debug pin. Outputs the final delay chain settings when DPA achieved lock. |

Table 64: EFX_LVDS_RX_V2 Pads

| Signal | Direction | Description |
|--------|-----------|---------------------|
| P | Output | Differential pad P. |
| N | Output | Differential pad N. |

EFX_LVDS_RX_V2 Parameters

Table 65: EFX_LVDS_RX_V2 Parameters

| Parameter | Allowed Values | Description |
|-----------------------|--|---|
| DESERIALIZATION_WIDTH | 1, 2, 3, 4, 5, 6, 7, 8, 10 | De-serialization factor of 2, 3, 4, 5, 6, 7, 8, or 10. 1 is a simple buffer. A width of 9 is not legal. |
| HALF_RATE_EN | 0, 1 | Use half-rate mode. 0: Disabled. 1: Enable half-rate de-serialization where fast clock runs at 1/2 the data-rate and captures data on both clock edges. Only even de-serialization values allowed with half-rate. |
| DESERIALIZATION_EN | 0, 1 | Bypass the de-serializer. 0: Disabled. 1: Bypass. |
| FIFO_EN | 0, 1 | Use the clock crossing FIFO. 0: Disabled. 1: Enabled. |
| TERMINATION_TYPE | ON, OFF, DYNAMIC | Use termination. ON: Enabled. OFF: Disabled. DYNAMIC: Use dynamic termination. This setting requires you to specify the e pin that controls the dynamic termination. |
| CONNECTION_TYPE | NORMAL, PLL_CLKIN, PLL_EXTFB, GCLK, RCLK | Alternate connection type. NORMAL: Normal LVDS RX function (same as choosing normal in the Interface Designer). PLL_CLKIN: Use as PLL reference clock. PLL_EXTFB: Use as PLL external feedback. GCLK: Use as global clock. RCLK: Use as regional clock. |
| DIFF_TYPE | LVDS, SLVS | Sets the differential type. |
| DELAY_MODE | STATIC, DYNAMIC, DPA | Sets the inout delay control. STATIC: Use the static delay value specified by DELAY. DYNAMIC: Specify the pin names to control the dynamic delay. DPA: Dynamic phase alignment automatically sets the delay value. |
| DELAY | 0 - 63 | Integer from 0 - 63. Each step adds approximately 25 ps of delay. |
| VOC_DRIVER_EN | 0, 1 | Enable or disable the internal common-mode voltage bias for the LVDS receiver. |

EFX_LVDS_TX_V2

LVDS Transmitter

This primitive represents the functionality of the HSIO when used as an LVDS transmitter.

Learn more: Refer to the data sheet for the complete description of the LVDS functionality and features. This user guide only describes the primitive ports and parameters.

EFX_LVDS_TX_V2 Ports

Figure 77: EFX_LVDS_TX_V2 Symbol

Table 66: EFX_LVDS_TX_V2 Ports

| Signal | Direction | Clock Domain | Description |
|---------|-----------|--------------|---|
| O[9:0] | Input | SLOWCLK | Parallel output data from the core. The width is programmable. |
| SLOWCLK | Input | - | Parallel (slow) clock. |
| FASTCLK | Input | - | Serial (fast) clock. |
| RST | Input | SLOWCLK | (Optional) This signal is available when serialization is enabled. Resets the serializer. |
| OE | Input | - | (Optional) Output enable signal. |

Table 67: EFX_LVDS_TX_V2 Pads

| Signal | Direction | Description |
|--------|-----------|---------------------|
| P | Output | Differential pad P. |
| N | Output | Differential pad N. |

EFX_LVDS_TX_V2 Parameters

Table 68: EFX_LVDS_TX_V2 Parameters

| Parameter | Allowed Values | Description |
|---------------------|------------------------------------|---|
| SERIALIZATION_WIDTH | 1 - 10 | Serialization factor. 1 is a simple buffer. |
| HALF_RATE_EN | 0, 1 | Use half-rate mode. 0: Disabled. 1: Enable half-rate serialization where fast clock runs at 1/2 the data-rate and captures data on both clock edges. Only even serialization values allowed with half-rate. |
| SERIALIZATION_EN | 0, 1 | Bypass the serializer. 0: Disabled. 1: Bypass. |
| MODE | DATA, CLKOUT | Sets the mode: DATA: Simple output buffer or serialized output. CLKOUT: Use the transmitter as a clock output. |
| PRE-EMPHASIS | LOW, MEDIUM_LOW, MEDIUM_HIGH, HIGH | Pre-emphasis setting. |
| DIFF_TYPE | LVDS, SUBLVDS, CUSTOM, SLVS | Output differential type. |
| VOD | LARGE, TYPICAL, SMALL | Sets the reduced VOD swing feature (similar to slow slew rate). |
| DELAY | 0 - 63 | Integer from 0 - 63. Each step adds approximately 25 ps of delay. |

EFX_LVDS_TX_V2 Function

These examples show how to instantiate the LVDS TX V2 primitive.

Figure 78: EFX_LVDS_TX_V2 Verilog HDL Instantiation

```

EFX_LVDS_TX_V2 # (

EFX_LVDS_BIDIR_V2

LVDS Transmitter/Receiver

This primitive represents the functionality of the HSIO when used as bi-directional LVDS.

Learn more: Refer to the data sheet for the complete description of the LVDS functionality and features. This user guide only describes the primitive ports and parameters.

EFX_LVDS_BIDIR_V2 Ports

Figure 80: EFX_LVDS_BIDIR_V2 Symbol

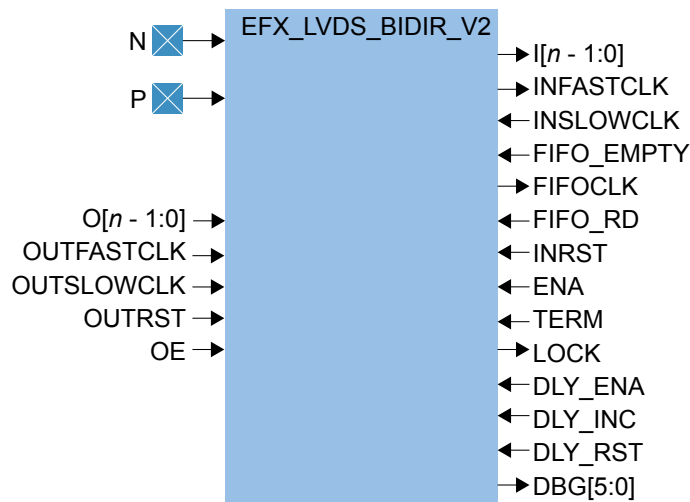

Table 69: EFX_LVDS_BIDIR_V2 Ports

| Signal | Direction | Clock Domain | Description |
|------------|-----------|--------------------|--|
| I[9:0] | Output | SLOWCLK | Parallel input data to the core. The width is programmable. |
| INSLOWCLK | Input | - | Parallel (slow) clock for RX. |
| INFASTCLK | Input | - | Serial (fast) clock for RX. |
| FIFO_EMPTY | Output | FIFOCLK | This signal is required when you turn on the Enable Clock Crossing FIFO option. Indicates that the FIFO is empty. |
| FIFOCLK | Input | - | This signal is required when you turn on the Enable Clock Crossing FIFO option. Core clock to read from the FIFO. |
| FIFO_RD | Input | FIFOCLK | This signal is required when you turn on the Enable Clock Crossing FIFO option. Enables FIFO to read. |
| INRST | Input | FIFOCLK SLOWCLK | This signal is available when deserialization is enabled. Asynchronous. Resets the FIFO and RX deserializer. If the FIFO is enabled, it is relative to FIFOCLK; otherwise it is relative to SLOWCLK. |

| Signal | Direction | Clock Domain | Description |
|------------|-----------|--------------|--|
| ENA | Input | - | Dynamically enable or disable the LVDS input buffer. Can save power when disabled. 1: Enabled 0: Disabled |
| TERM | Input | - | The signal is available when dynamic termination is enabled. Enables or disables termination in dynamic termination mode. 1: Enabled 0: Disabled |
| LOCK | Output | - | (Optional) This signal is available when you set Delay Mode to dpa . Indicates that the DPA has achieved training lock and data can be passed. |
| DLY_ENA | Input | SLOWCLK | This signal is required when you set Delay Mode to dynamic or dpa . Enable the dynamic delay control or the DPA circuit, depending on the bidirectional LVDS delay settings. |
| DLY_INC | Input | SLOWCLK | This signal is required when you set Delay Mode to dynamic . Dynamic delay control. Cannot be used with DPA enabled. When DLY_ENA is 1, 1: Increments 0: Decrements |
| DLY_RST | Input | SLOWCLK | (Optional) This signal is available when you set Delay Mode to dpa or dynamic . Reset the delay counter or the DPA circuit, depending on the bidirectional LVDS delay settings. |
| DBG[5:0] | Output | SLOWCLK | DPA debug pin. Outputs the final delay chain settings when DPA achieved lock. |
| O[9:0] | Input | SLOWCLK | Parallel output data from the core. The width is programmable. |
| OUTSLOWCLK | Input | - | Parallel (slow) clock for TX. |
| OUTFASTCLK | Input | - | Serial (fast) clock for TX. |
| OUTRST | Input | SLOWCLK | This signal is available when serialization is enabled. Resets the TX serializer. |
| OE | Input | - | Output enable signal. |

Table 70: EFX_LVDS_BIDIR_V2 Pads

| Signal | Direction | Description |
|--------|-----------|---------------------|
| P | Output | Differential pad P. |
| N | Output | Differential pad N. |

EFX_LVDS_BIDIR_V2 Parameters

Table 71: EFX_LVDS_BIDIR_V2 Parameters

| Parameter | Allowed Values | Description |
|--------------------------|--|---|
| IN_DESERIALIZATION_WIDTH | 1, 2, 3, 4, 5, 6, 7, 8, 10 | De-serialization factor of 2, 3, 4, 5, 6, 7, 8, or 10. 1 is a simple buffer. A width of 9 is not legal. |
| IN_HALF_RATE_EN | 0, 1 | Use half-rate mode. 0: Disabled. 1: Enable half-rate de-serialization where fast clock runs at 1/2 the data-rate and captures data on both clock edges. Only even de-serialization values allowed with half-rate. |
| IN_DESERIALIZATION_EN | 0, 1 | Bypass the de-serializer. 0: Disabled. 1: Bypass. |
| IN_DELAY_MODE | STATIC, DYNAMIC, DPA | Sets the inout delay control. STATIC: Use the static delay value specified by DELAY. DYNAMIC: Specify the pin names to control the dynamic delay. DPA: Dynamic phase alignment automatically sets the delay value. |
| IN_FIFO_EN | 0, 1 | Use the clock crossing FIFO. 0: Disabled. 1: Enabled. |
| IN_TERMINATION_TYPE | ON, OFF, DYNAMIC | Use termination. ON: Enabled. OFF: Disabled. DYNAMIC: Use dynamic termination. This setting requires you to specify the pin that controls the dynamic termination. |
| INDELAY | 0 - 63 | Integer from 0 - 63. Each step adds approximately 25 ps of delay. |
| IN_DIFF_TYPE | LVDS, SLVS | Sets the differential type. |
| IN_CONNECTION_TYPE | NORMAL, PLL_CLKIN, PLL_EXTFB, GCLK, RCLK | Alternate connection type. NORMAL: Normal LVDS RX function (same as choosing normal in the Interface Designer). PLL_CLKIN: Use as PLL reference clock. PLL_EXTFB: Use as PLL external feedback. GCLK: Use as global clock. RCLK: Use as regional clock. |
| IN_VOC_DRIVER_EN | 0, 1 | Enable or disable the internal common-mode voltage bias for the LVDS receiver. |
| OUT_SERIALIZATION_WIDTH | 1 - 10 | Serialization factor. 1 is a simple buffer. |

| Parameter | Allowed Values | Description |
|----------------------|------------------------------------|---|
| OUT_HALF_RATE_EN | 0, 1 | Use half-rate mode. 0: Disabled. 1: Enable half-rate serialization where fast clock runs at 1/2 the data-rate and captures data on both clock edges. Only even serialization values allowed with half-rate. |
| OUT_SERIALIZATION_EN | 0, 1 | Bypass the serializer. 0: Disabled. 1: Bypass. |
| OUT_MODE | DATA, CLKOUT | Sets the mode: DATA: Simple output buffer or serialized output. CLKOUT: Use the transmitter as a clock output. |
| OUT_PRE-EMPHASIS | LOW, MEDIUM_LOW, MEDIUM_HIGH, HIGH | Pre-emphasis setting. |
| OUT_DIFF_TYPE | LVDS, SUBLVDS, CUSTOM, SLVS | Output differential type. |
| OUT_VOD | LARGE, TYPICAL, SMALL | Sets the reduced VOD swing feature (similar to slow slew rate). |
| OUTDELAY | 0 - 63 | Integer from 0 - 63. Each step adds approximately 25 ps of delay. |

EFX_MIPI_RX_LN_V1

MIPI Receiver

This primitive represents the functionality of the HSIO when used as a MIPI receiver.

Learn more: Refer to the data sheet for the complete description of the MIPI functionality and features. This user guide only describes the primitive ports and parameters.

EFX_MIPI_RX_LN_V1 Ports

Figure 83: EFX_MIPI_RX_LN_V1 Symbol

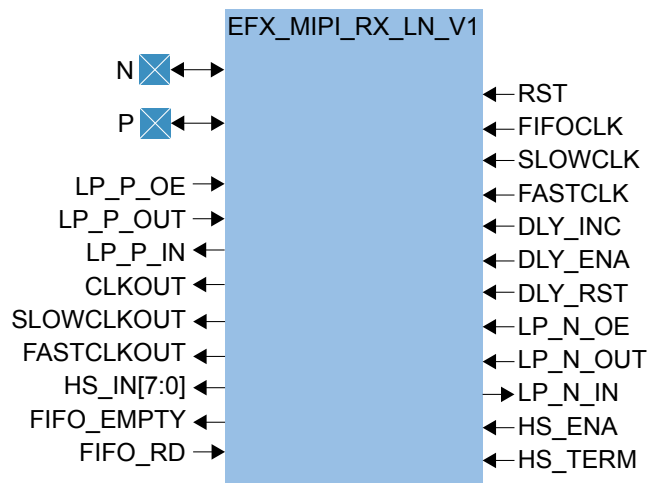

Table 72: EFX_MIPI_RX_LN_V1 Ports

| Signal | Direction | Clock Domain | Description |
|---------------------------|-----------|--------------|---|
| LP_P_OE | Input | - | (Optional) LP output enable signal for P pad. |
| LP_P_OUT | Input | - | (Optional) LP output data from the core for the P pad. Used if the data lane is reversible. |
| LP_P_IN | Output | - | LP input data from the P pad. |
| CLKOUT | Output | - | Divided down parallel (slow) clock from the pads that can drive the core clock tree. Used to drive the core logic implementing the rest of the D-PHY protocol. It should also connect to the FIFOCLK of the data lanes. |
| SLOWCLKOUT ⁽⁵⁾ | Output | - | Divided down parallel (slow) clock from the pads. Can only drive RX DATA lanes. |
| FASTCLKOUT ⁽⁵⁾ | Output | - | Serial (fast) clock from the pads. Can only drive RX DATA lanes. |
| HS_IN[7:0] | Output | SLOWCLK | High-speed parallel data input. |
| FIFO_EMPTY | Output | FIFOCLK | (Optional) When the FIFO is enabled, this signal indicates that the FIFO is empty. |

⁽⁵⁾ These signals are in the primitive, but the software automatically connects them for you.

| Signal | Direction | Clock Domain | Description |
|------------------------|-----------|--------------------|--|
| FIFO_RD | Input | FIFOCLK | (Optional) Enables FIFO to read. |
| RST | Input | FIFOCLK SLOWCLK | (Optional) Asynchronous. Resets the FIFO and serializer. If the FIFO is enabled, it is relative to FIFOCLK; otherwise it is relative to SLOWCLK. |
| FIFOCLK ⁽⁵⁾ | Input | - | (Optional) Core clock to read from the FIFO. |
| SLOWCLK ⁽⁵⁾ | Input | - | Parallel (slow) clock. |
| FASTCLK ⁽⁵⁾ | Input | - | Serial (fast) clock. |
| DLY_INC | Input | SLOWCLK | (Optional) Dynamic delay control. When DLY_ENA is 1, 1: Increments 0: Decrements |
| DLY_ENA | Input | SLOWCLK | (Optional) Enable the dynamic delay control. |
| DLY_RST | Input | SLOWCLK | (Optional) Reset the delay counter. |
| LP_N_OE | Input | - | (Optional) LP output enable signal for N pad. |
| LP_N_OUT | Input | - | (Optional) LP output data from the core for the N pad. Used if the data lane is reversible. |
| LP_N_IN | Output | - | LP input data from the N pad. |
| HS_ENA | Input | - | Dynamically enable the differential input buffer when in high-speed mode. |
| HS_TERM | Input | - | Dynamically enables input termination high-speed mode. |

Table 73: EFX_MIPI_RX_LN_V1 Pads

| Signal | Direction | Description |
|--------|---------------|---------------------|
| P | Bidirectional | Differential pad P. |
| N | Bidirectional | Differential pad N. |

EFX_MIPI_RX_LN_V1 Parameters

Table 74: EFX_MIPI_RX_LN_V1 Parameters

| Parameter | Allowed Values | Description |
|-----------------|-----------------|---|
| MODE | DATA, CLOCK | Choose whether the block is a clock lane or data lane: DATA: Data lane. CLOCK: Clock lane. |
| REVERSIBLE | 0, 1 | Indicates the lane can be reversed and send data in low-speed mode. Can only be used in DATA mode. 0: Disabled. 1: Enabled. |
| DELAY_MODE | STATIC, DYNAMIC | Sets the inout delay control. STATIC: Use the static delay value specified by DELAY. DYNAMIC: Specify the pin names to control the dynamic delay. |
| FIFO_EN | 0, 1 | Use the clock crossing FIFO. 0: Disabled. 1: Enabled. |
| DELAY | 0 - 63 | Integer from 0 - 63. Each step adds approximately 25 ps of delay. |
| CONNECTION_TYPE | GCLK, RCLK | Alternate connection type in CLOCK mode. GCLK: Use as global clock. RCLK: Use as regional clock. |

EFX_MIPI_TX_LN_V1 Ports

Figure 86: EFX_MIPI_TX_LN_V1 Symbol

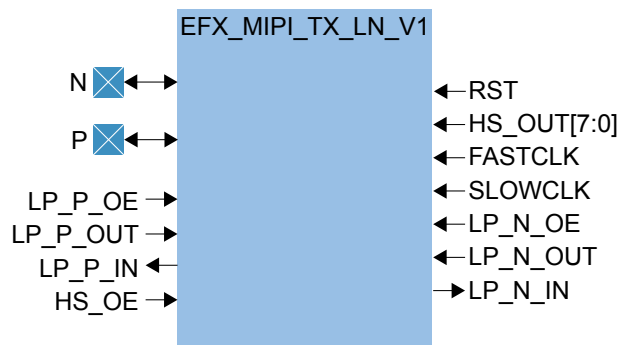

Table 75: EFX_MIPI_TX_LN_V1 Ports

| Signal | Direction | Clock Domain | Description |
|-------------|-----------|--------------|---|
| LP_P_OE | Input | - | LP output enable signal for P pad. |
| LP_P_OUT | Input | - | LP output data from the core for the P pad. |
| LP_P_IN | Output | - | (Optional) LP input data from the P pad. Used if data lane is reversible. |
| HS_OE | Input | - | High-speed output enable signal. |
| RST | Input | SLOWCLK | (Optional) Resets the serializer. |
| HS_OUT[7:0] | Input | SLOWCLK | High-speed output data from the core. Always 8-bits wide. |
| SLOWCLK | Input | - | Parallel (slow) clock. |
| FASTCLK | Input | - | Serial (fast) clock. |
| LP_N_OE | Input | - | LP output enable signal for N pad. |
| LP_N_OUT | Input | - | LP output data from the core for the N pad. |
| LP_N_IN | Output | - | (Optional) LP input data from the N pad. Used if data lane is reversible. |

Table 76: EFX_MIPI_TX_LN_V1 Pads

| Signal | Direction | Description |
|--------|---------------|---------------------|
| P | Bidirectional | Differential pad P. |
| N | Bidirectional | Differential pad N. |

This primitive represents the functionality of the HSIO when used as a MIPI receiver.

Learn more: Refer to the data sheet for the complete description of the MIPI functionality and features. This user guide only describes the primitive ports and parameters.

EFX_MIPI_RX_CLK_LN_V1 Ports

Figure 89: EFX_MIPI_RX_CLK_LN_V1 Symbol

Table 78: EFX_MIPI_RX_CLK_LN_V1 Ports

| Signal | Direction | Clock Domain | Description |
|---------------------------|-----------|--------------|---|
| SLOWCLKOUT ⁽⁶⁾ | Output | - | Divided down parallel (slow) clock from the pads. Can only drive RX DATA lanes. |
| FASTCLKOUT ⁽⁶⁾ | Output | - | Serial (fast) clock from the pads. Can only drive RX DATA lanes. |
| LP_P_IN | Output | - | LP input data from the P pad. |
| LP_N_IN | Output | - | LP input data from the N pad. |
| HS_ENA | Input | - | Dynamically enable the differential input buffer when in high-speed mode. |
| HS_TERM | Input | - | Dynamically enables input termination high-speed mode. |

Table 79: EFX_MIPI_RX_CLK_LN_V1 Pads

| Signal | Direction | Description |
|--------|---------------|---------------------|
| P | Bidirectional | Differential pad P. |
| N | Bidirectional | Differential pad N. |

⁽⁶⁾ These signals are in the primitive, but the software automatically connects them for you.

EFX_MIPI_RX_CLK_LN_V1 Parameters

Table 80: EFX_MIPI_RX_CLK_LN_V1 Parameters

| Parameter | Allowed Values | Description |
|-----------------|----------------|--|
| DELAY | 0 - 63 | Integer from 0 - 63. Each step adds approximately 25 ps of delay. |
| CONNECTION_TYPE | GCLK, RCLK | Alternate connection type in CLOCK mode. GCLK: Use as global clock. RCLK: Use as regional clock. |

EFX_MIPI_RX_CLK_LN_V1 Function

EFX_PLL_V3

Full-Featured PLL

This PLL is available in Ti35, Ti60, Ti90, Ti120, and Ti180 FPGAs.

Learn more: Refer to the data sheet for the complete description of the PLL functionality and features. This user guide only describes the primitive ports and parameters.

EFX_PLL_V3 Ports

Figure 92: EFX_PLL_V3 Symbol

Table 81: EFX_PLL_V3 Ports

| Signal | Direction | Description |
|---|-----------|--|
| CLKIN[3:0] | Input | Reference clocks driven by I/O pads or core clock tree. |
| CLKSEL[1:0] | Input | You can dynamically select the reference clock from one of the clock in pins. |
| RSTN | Input | Active-low PLL reset signal. When asserted, this signal resets the PLL; when de-asserted, it enables the PLL. De-assert only when the CLKIN signal is stable. Connect this signal in your design to power-up or reset the PLL. Assert the RSTN pin for a minimum pulse of 10 ns to reset the PLL. Assert RSTN when dynamically changing the selected PLL reference clock. |
| FBK | Input | Connect to a clock out interface pin when the PLL is in when the PLL is not in internal feedback mode. |
| CLKOUT0 CLKOUT1 CLKOUT2 CLKOUT3 CLKOUT4 | Output | PLL output. You can route these signals as input clocks to the core's GCLK network. : CLKOUT4 can only feed the top or bottom regional clocks. : All PLL outputs lock on the negative clock edge. The Interface Designer inverts the clock polarity on the leaf cells by default (Invert Output Clock option unchecked). Check the option if you are using the clock to drive core logic. You can use CLKOUT0 only for clocks with a maximum frequency of 4x (integer) of the reference clock. If all your system clocks do not fall within this range, you should dedicate one unused clock for CLKOUT0. |
| LOCKED | Output | Goes high when PLL achieves lock; goes low when a loss of lock is detected. Connect this signal in your design to monitor the lock status. This signal is not synchronized to any clock and the minimum high or low pulse width of the lock signal may be smaller than the CLKOUT's period. |

| Signal | Direction | Description |
|----------------|-----------|--|
| SHIFT[2:0] | Input | (Optional) Dynamically change the phase shift of the output selected to the value set with this signal. Possible values from 000 (no phase shift) to 111 (3.5 F _{PLL} cycle delay). Each increment adds 0.5 cycle delay. |
| SHIFT_SEL[4:0] | Input | (Optional) Choose the output(s) affected by the dynamic phase shift. |
| SHIFT_ENA | Input | (Optional) When high, changes the phase shift of the selected PLL(s) to the new value. |

EFX_PLL_V3 Parameters

Table 82: EFX_PLL_V3 Parameters

| Parameter | Allowed Values | Description |
|---------------------|---------------------------------|---|
| N | 1, 2, 4 | Pre-divider. |
| M | 1, 2, 4 | Multiplier. |
| O | 1, 2, 4, 8, 16, 32, 64, 128 | Post divider. |
| CLKOUT0_DIV | 1 - 128 | Output divider for CLKOUT0. |
| CLKOUT1_DIV | 1 - 128 | Output divider for CLKOUT1. |
| CLKOUT2_DIV | 1 - 128 | Output divider for CLKOUT2. |
| CLKOUT3_DIV | 1 - 128 | Output divider for CLKOUT3. |
| CLKOUT4_DIV | 1 - 128 | Output divider for CLKOUT4. |
| CLKOUT0_PHASE_STEP | 0 - 7 | Output phase for CLKOUT0. |
| CLKOUT1_PHASE_STEP | 0 - 7 | Output phase for CLKOUT1. |
| CLKOUT2_PHASE_STEP | 0 - 7 | Output phase for CLKOUT2. |
| CLKOUT3_PHASE_STEP | 0 - 7 | Output phase for CLKOUT3. |
| CLKOUT4_PHASE_STEP | 0 - 7 | Output phase for CLKOUT4. |
| FEEDBACK_CLK | CLK0, CLK1, CLK2, CLK3, CLK4 | Indicates which clock is the feedback clock. |
| FEEDBACK_MODE | LOCAL, CORE, EXTERNAL | Indicates the feedback mode. |
| REFCLK_FREQ | 16 - 800 | Reference clock frequency. |
| IS_CLKOUT0_INVERTED | 0, 1 | Invert output clock for CLKOUT0. |
| IS_CLKOUT1_INVERTED | 0, 1 | Invert output clock for CLKOUT1. |
| IS_CLKOUT2_INVERTED | 0, 1 | Invert output clock for CLKOUT2. |
| IS_CLKOUT3_INVERTED | 0, 1 | Invert output clock for CLKOUT3. |
| IS_CLKOUT4_INVERTED | 0, 1 | Invert output clock for CLKOUT4. |
| CLKOUT3_CONN_TYPE | GCLK, RCLK | Specifies local or regional connection for CLKOUT3. (Not applicable to Ti35 or Ti60) |
| CLKOUT4_CONN_TYPE | GCLK, RCLK | Specifies local or regional connection for CLKOUT4. (Not applicable to Ti35 or Ti60) |
| CLKOUT0_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT0. |
| CLKOUT1_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT1. |

| Parameter | Allowed Values | Description |
|---------------------|----------------|---|
| CLKOUT2_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT2. |
| CLKOUT3_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT3. |
| CLKOUT4_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT4. |

EFX_FPLL_V1

Fractional PLL

This PLL is available in Ti85, Ti135, Ti165, Ti240, and Ti375 FPGAs.

Learn more: Refer to the data sheet for the complete description of the fractional PLL functionality and features. This user guide only describes the primitive ports and parameters.

EFX_FPLL_V1 Ports

Figure 95: EFX_FPLL_V1 Symbol

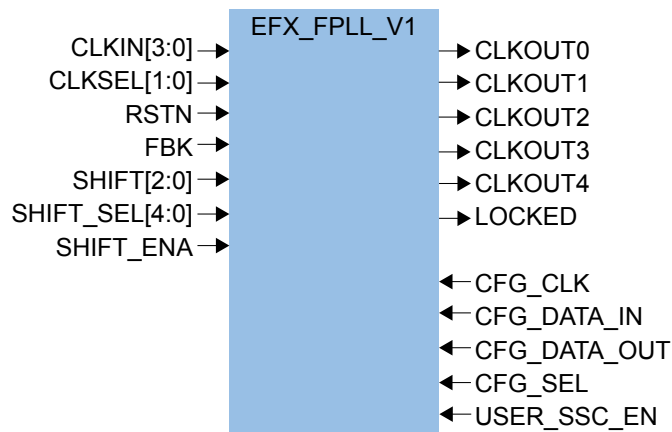

Table 83: EFX_FPLL_V1 Ports

| Signal | Direction | Description |
|---|-----------|---|
| CLKIN[3:0] | Input | Reference clocks driven by I/O pads or core clock tree. In dynamic mode, the CLKSEL pin chooses which of these inputs to use. |
| CLKSEL[1:0] | Input | You can dynamically select the reference clock from one of the clock in pins. |
| RSTN | Input | (Optional) Active-low PLL reset signal. When asserted, this signal resets the PLL; when de-asserted, it enables the PLL. De-assert only when the CLKIN signal is stable. Connect this signal in your design to power-up or reset the PLL. Assert the RSTN pin for a minimum pulse of 10 ns to reset the PLL. Assert RSTN when dynamically changing the selected PLL reference clock. |
| FBK | Input | Connect to a clock out interface pin when the PLL is not in internal feedback mode. Required when any output is using dynamic phase shift. |
| CLKOUT0 CLKOUT1 CLKOUT2 CLKOUT3 CLKOUT4 | Output | PLL output. You can route these signals as input clocks to the core's GCLK network. The PLL output clock used as the feedback clock can have a maximum frequency of 4x (integer) of the reference clock. If all your system clocks do not fall within this range, you should dedicate one unused PLL output clock for feedback. |

| Signal | Direction | Description |
|----------------|-----------|---|
| LOCKED | Output | (Optional) Goes high when PLL achieves lock; goes low when a loss of lock is detected. Connect this signal in your design to monitor the lock status. This signal is not synchronized to any clock and the minimum high or low pulse width of the lock signal may be smaller than the CLKOUT's period. |
| SHIFT[2:0] | Input | (Optional) Dynamically change the phase shift of the output selected to the value set with this signal. Possible values from 000 (no phase shift) to 111 (3.5 F _{PLL} cycle delay). Each increment adds 0.5 cycle delay. Required when any output is using dynamic phase shift. |
| SHIFT_SEL[4:0] | Input | (Optional) Choose the output(s) affected by the dynamic phase shift. Required when any output is using dynamic phase shift. |
| SHIFT_ENA | Input | (Optional) When high, changes the phase shift of the selected PLL(s) to the new value. Required when any output is using dynamic phase shift. |
| CFG_CLK | Input | Configuration clock pin name; used with dynamic configuration. |
| CFG_DATA_IN | Input | Configuration data input pin name; used with dynamic configuration. |
| CFG_DATA_OUT | Output | Configuration data output pin name; used with dynamic configuration. |
| CFG_SEL | Input | Configuration select pin name; used with dynamic configuration. |
| USER_SSC_EN | Input | User spread-spectrum clocking enable pin name. |

EFX_FPLL_V1 Parameters

Table 84: EFX_FPLL_V1 Parameters

| Parameter | Allowed Values | Description |
|--------------------|---------------------------------|--|
| N | 1, 2, 4 | Pre-divider. |
| M | 1, 2, 4 | Multiplier. |
| O | 1, 2, 4, 8, 16, 32, 64, 128 | Post divider. |
| CLKOUT0_DIV | 1 - 128 | Output divider for CLKOUT0. |
| CLKOUT1_DIV | 1 - 128 | Output divider for CLKOUT1. |
| CLKOUT2_DIV | 1 - 128 | Output divider for CLKOUT2. |
| CLKOUT3_DIV | 1 - 128 | Output divider for CLKOUT3. |
| CLKOUT4_DIV | 1 - 128 | Output divider for CLKOUT4. |
| CLKOUT0_PHASE_STEP | 0 - 7 | Output phase for CLKOUT0. |
| CLKOUT1_PHASE_STEP | 0 - 7 | Output phase for CLKOUT1. |
| CLKOUT2_PHASE_STEP | 0 - 7 | Output phase for CLKOUT2. |
| CLKOUT3_PHASE_STEP | 0 - 7 | Output phase for CLKOUT3. |
| CLKOUT4_PHASE_STEP | 0 - 7 | Output phase for CLKOUT4. |
| FEEDBACK_CLK | CLK0, CLK1, CLK2, CLK3, CLK4 | Indicates which clock is the feedback clock. |
| FEEDBACK_MODE | LOCAL, CORE, EXTERNAL | Indicates the feedback mode. |

| Parameter | Allowed Values | Description |
|----------------------------|--------------------------|--|
| REFCLK_FREQ | 16 - 800 | Reference clock frequency. |
| IS_CLKOUT0_INVERTED | 0, 1 | Invert output clock for CLKOUT0. |
| IS_CLKOUT1_INVERTED | 0, 1 | Invert output clock for CLKOUT1. |
| IS_CLKOUT2_INVERTED | 0, 1 | Invert output clock for CLKOUT2. |
| IS_CLKOUT3_INVERTED | 0, 1 | Invert output clock for CLKOUT3. |
| IS_CLKOUT4_INVERTED | 0, 1 | Invert output clock for CLKOUT4. |
| CLKOUT3_CONN_TYPE | GCLK, RCLK | Specifies local or regional connection for CLKOUT3. (Not applicable to Ti35 or Ti60) |
| CLKOUT4_CONN_TYPE | GCLK, RCLK | Specifies local or regional connection for CLKOUT4. (Not applicable to Ti35 or Ti60) |
| CLKOUT0_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT0. |
| CLKOUT1_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT1. |
| CLKOUT2_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT2. |
| CLKOUT3_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT3. |
| CLKOUT4_DYNPHASE_EN | 0, 1 | Enable dynamic phase shift control for CLKOUT4. |
| DYNAMIC_CFG_EN | 0, 1 | Enable dynamic reconfiguration. |
| SSC_MODE | DISABLE, STATIC, DYNAMIC | Spread-spectrum clocking mode. |
| SSC_FREQUENCY | 30 - 33 | SSC modulation frequency. |
| SSC_AMPLITUDE | 0 - 0.5 | SSC modulation amplitude. |
| SSC_MODULATION_TYPE | DOWN, UP, CENTER | SSC spread direction. |
| CLKOUT1_FRAC_EN | 0, 1 | Enable fractional mode. |
| CLKOUT1_FRAC_K | | Specify fractional coefficient. |
| CLKOUT1_DC_ODD | 0, 1 | Enable half VCO shift for CLKOUT1. |
| CLKOUT1_DC_PDIV | 1 - 64 | P divider for CLKOUT1. |
| CLKOUT1_DC_SDIV | 1 - 64 | S divider for CLKOUT1. |
| CLKOUT1_PROG_DUTY_CYCLE_EN | 0, 1 | Enable programmable duty cycle. |
| CLKOUT1_DUTY_CYCLE | 0 - 99 | Actual duty cycle for CLKOUT1. |

EFX_OSC_V3

Titanium Oscillator

This oscillator is available in Titanium FPGAs.

Learn more: Refer to the data sheet for the complete description of the oscillator functionality and features. This user guide only describes the primitive ports and parameters.

EFX_OSC_V3 Ports

Figure 98: EFX_OSC_V3 Symbol

Table 85: EFX_OSC_V3 Ports

| Port | Direction | Description |
|--------|-----------|--------------------------|
| CLKOUT | Output | Oscillator clock output. |
| ENA | Input | Enable for oscillator. |

EFX_OSC_V3 Parameters

Table 86: EFX_IREG Parameters

| Parameter | Allowed Values | Description |
|-----------|----------------|------------------------------|
| FREQ | 10, 20, 40, 80 | Oscillator frequency in MHz. |

EFX_OSC_V3 Function

These examples show how to instantiate the OSC V3 primitive.

Figure 99: EFX_OSC_V3 Verilog HDL Instantiation

```
EFX_OSC_V3 # (
  .FREQ(10)
) EFX_OSC_V3_inst(
  .CLKOUT(CLKOUT), // Output Clock
  .ENA(ENA)        // Clock Enable
);
```

Figure 100: EFX_OSC_V1 VHDL Instantiation

```
library IEEE;
use IEEE.STD_LOGIC_1164.ALL;
library efxphysicallib;
use efxphysicallib.efxcomponents.all

entity EFX_OSC_V3_VHDL is
port ( clkout : out std_logic;
      ena : in std_logic
);
end entity EFX_OSC_V3_VHDL;

architecture Behavioral of EFX_OSC_V3_VHDL is
begin
  EFX_OSC_V3_inst : EFX_OSC_V3
    generic map (
      FREQ => 10
    )
    port map (
      CLKOUT => clkout,
      ENA => ena
    );
end architecture Behavioral;
```

Revision History

Table 87: Revision History

| Date | Version | Description |
|---------------|---------|---|
| February 2026 | 3.4 | Added missing REFCLK in VHDL function for EFX_PLL_V3 Function on page 119 and EFX_FPLL_V1 Function on page 123. (DOC-2913) |
| November 2025 | 3.3 | Updated DSP block diagram. 2-1 multiplexer moved to after the W Register. Removed text that you need to disable the W register if you bypass the adder. (DOC-2592) Fixed typo. (DOC-2729) Removed HS_IN port from EFX_MIPI_RX_CLK_LN. (DOC-2747) Added MIPI interface primitives. (DOC-2674) |
| July 2025 | 3.2 | Corrected VHDL and Verilog HDL instantiation examples for EFX_PLL_V3 Function on page 119. (DOC-2580) |
| June 2025 | 3.1 | Corrected EFX_ADD parameter; IO_POLARITY should be I0_POLARITY (zero not letter O). (DOC-2580) |
| May 2025 | 3.0 | Added LVDS interface primitives. (DOC-2483) Corrected syntax errors for interface primitive instantiations. (DOC-2194) Corrected EFX_FPLL_V1 (SCC instead of SSC for parameters and instantiation examples). (DOC-2437) Updated supported devices for EFX_JTAG_CTRL primitive. |
| November 2024 | 2.0 | Added interface primitives. (DOC-2086) |
| June 2024 | 1.7 | For the EXF_DSP12, EXF_DSP24, and EXF_DSP48 primitives, when N_SEL is O the W and O registers must be enabled. (DOC-1863) |
| November 2023 | 1.6 | Corrected EFX_DPRAM10 Symbol figure signal name. (DOC-1544) Improved Allowed Read and Write Mode Combinations tables for EFX_RAM_5K and EFX_DRRAM_5K. (DOC-1566) Added description about EFX_SRL8 Q7 port and only be connected to the Q of another EFX_SRL8. (DOC-1569) |
| June 2023 | 1.5 | Updated table EFX_FF Parameters. (DOC-1237) Added in new section for EFX_DSP48, EFX_DSP24, and EFX_DSP12. (DOC-1294) |
| March 2023 | 1.4 | Updated port map in EFX_DSP48, EFX_DSP 24 and EFX_DSP 12 VHDL Instantiation. (DOC-1110) |
| August 2022 | 1.3 | The legal values for the EFX_DSP48, EFX_DSP24, and EFX_DSP12 blocks W_SEL parameter are P or X. (DOC-894) Removed the OVFL() signal from the EFX_DSP24 and EFX_DSP12 Verilog HDL examples. These blocks do not have this signal. (DOC-894) |
| August 2022 | 1.2 | Input output functions at EX4_COMB4 (Arithmetic Mode) at PROP and GEN column. (DOC-848) |
| April 2022 | 1.1 | The DSP RST_SYNC parameter applies to more than just the A register. (DOC-785) |
| June 2021 | 1.0 | Initial release. |
